NATIONAL POPULATION AND HOUSING CENSUS 2024

Final Report - Volume 1 (Main)

DECEMBER 2024

This report presents the final results from the National Population and Housing Census 2024 undertaken by the Uganda Bureau of Statistics (UBOS).

Recommended Citation

Uganda Bureau of Statistics 2024: The National Population and Housing Census 2024 – Final Report - Volume 1 (Main), Kampala, Uganda.

PREFACE

On behalf of the Uganda Bureau of Statistics (UBOS), I am pleased to present the Final Report of the National Population and Housing Census 2024. This monumental exercise, conducted under the theme “*It matters to be counted*”, marks a significant milestone in Uganda’s journey towards evidence-based planning and decision-making for inclusive development.

The National Population and Housing Census 2024 was a comprehensive endeavor to provide up-to-date and reliable data on the size and characteristics of Uganda’s population, and housing stock by type. This information is indispensable for guiding planning, policies and programmes aimed at fostering socio-economic transformation, promoting equitable service delivery, and achieving Uganda’s Vision 2040.

This National Population and Housing Census, which leveraged advanced technologies and methodologies, was the most inclusive and technologically enhanced population enumeration exercise ever conducted in Uganda. The use of digital data collection tools ensured real-time monitoring, which improved data accuracy and timeliness. Furthermore, extensive community engagement ensured that no one was left behind, emphasizing the importance of inclusivity in the country’s national statistics.

The success of the National Population and Housing Census 2024 is a testament to the collaborative efforts of various stakeholders. We extend our heartfelt gratitude to the Government of Uganda for its unwavering support and commitment, particularly for funding 98 percent of the Census 2024. The Bureau also acknowledges the invaluable contributions of our Development Partners, namely the United Nations Population Fund, the United Nations High Commission for Refugees, the United Nations Children Fund, World Food Programme and United Nations Development Programme, who contributed the remaining 2 percent. Gratitude is further extended to the United Nations Economic Commission for Africa (UNECA) - Africa Centre for Statistics for their technical support in preparations for National Population and Housing Census 2024. The immense contribution of Local Governments in undertaking the Census exercise in the respective jurisdictions, Civil Society Organizations, the academia and the media is well acknowledged. Most importantly, we thank the people of Uganda for their cooperation that made the exercise a success.

The Bureau urges all stakeholders—policymakers, planners, researchers, Development Partners and the private sector to utilize this wealth of information from the Census to drive Uganda’s development agenda. The final report serves as a vital tool for understanding Uganda’s evolving landscape. As we move forward, UBOS remains committed to providing high-quality statistical information to support evidence-based decision-making and foster sustainable development. Let these insights inspire initiatives that enhance the well-being of all Ugandans, ensuring no one is left behind.

Together, let us build a data-driven future for Uganda.

FOREWORD

Uganda conducted her 6th post-independence National Population and Housing Census in May 2024. This Census was technologically driven, with 135,230 field staff involved in data collection using electronic devices referred to as tablets.

The National Population and Housing Census 2024 provides information for evaluating the Third National Development Plan (NDPIII), baseline information for the NDPIV, as well as facilitating monitoring of Government investments, programmes and projects. Other beneficiaries of the Census data include Faith-Based Organisations, Cultural Institutions, Non-Governmental Organizations, Research and Training Institutions, and International community.

The preliminary findings were disseminated on 27th June 2024, providing statistics on population size, distribution and composition up to the District/City level. The provisional results were disseminated on 3rd October 2024.

The final report presents the final results of the National Population and Housing Census 2024 with data and statistics for key indicators reported at District/City level. The report gives statistics on the demographic, socio-economic and environmental characteristics of the population, as well as information about the households and communities where they reside. Detailed statistics up to Parish level, giving baseline data and information for planning at Lower Local Governments (LLGs) including Localisation of SDGs and Parish Development Model (PDM) will be published in March 2025.

The success of the Census, 2024 was made possible through the collective efforts of the Government of Uganda, local authorities, Development Partners, and the people of Uganda. We extend our deepest gratitude to all who contributed to this critical national exercise. In particular, the National Census Council (Cabinet Sub-committee on Census) chaired by the Rt. Hon Prime Minister; the National Census Steering Committee chaired by the Permanent Secretary / Secretary to the Treasury; the Board Census Committee; Census Management Team, District/City Census Committees, as well UBOS and Census enumeration staff (including District/City staff and LC1s) who worked tirelessly for a successful NPHC 2024.

The Bureau appreciates the Ministry of Finance, Planning and Economic Development, Electoral Commission, Uganda Peoples' Defence Forces, Uganda Prisons Services, Uganda Police Force, Internal Security Organisation and Local Governments for their financial, technical and logistical support.

Finally, we urge the public to utilize the census data and statistical information for planning, policy design, programme/project implementation, decision making and public debates.

It matters to be counted

EXECUTIVE SUMMARY

The Uganda Bureau of Statistics (UBOS) is delighted to present the final report of the National Population and Housing Census 2024. This report shows a comprehensive picture of Uganda's demographic and socio-economic landscape, offering critical insights for planning and decision-making at all levels of Government.

Overview of the Census

The National Population and Housing Census 2024 was conducted in line with international best practices and guided by the need to produce accurate, relevant, and timely data. Covering all households and individuals across the country, this census marks a significant milestone in Uganda's journey towards data-driven development. The specific objectives of the NPHC 2024 were:

- i) To ascertain size, structure and distribution of the population
- ii) To gather data on housing conditions and access to basic services
- iii) To monitor changes in key social and economic indicators since the previous Census
- iv) To update census maps and lists of Enumeration Areas for effective execution of the census, construction of efficient area sampling frames for subsequent surveys and geographical maps at the lowest level.
- v) To establish the statistical infrastructure for future operations at the lowest Local Government level.
- vi) To further enhance the capacity of UBOS staff to undertake future censuses and large-scale sample surveys.
- vii) Inform policies and programmes aimed at improving the quality of life of all Ugandans

Uses of National Population and Housing Censuses

The findings of the 2024 Census will be instrumental in shaping Uganda's development agenda. They provide a basis for:

- a) **Planning:** Facilitating evidence-based National and Local Government planning processes.
- b) **Resource Allocation:** Enabling equitable distribution of resources across programmes and Local Governments.
- c) **Program Design:** Informing interventions in social services such as health, education, infrastructure, and housing, to mention a few.
- d) **Monitoring Progress:** Tracking Uganda's advancements towards achieving socio-economic transformation as envisioned in Vision 2040, the National Development Plans, as well as regional, continental and global development initiatives.

Key Findings

1. **Population Size and Growth:** Uganda's population as of May 2024 was 45,905,417 persons, reflecting an average annual growth rate of 2.9 percent since the last Census in 2014.
2. **Demographic Composition:** A half of the population is under the age of 18. Five in every one hundred persons are aged 60 and above.
3. **Housing and Living Conditions:**
 - i) Eight in ten (81.1%) households have access to improved water sources
 - ii) Slightly over a half (53.4%) of households have access to electricity (25.3% from grid and 28.1% from solar).
4. **Literacy:** Seventy four percent of persons aged 10 and above were able to read and write meaningfully in any language.

5. Well-being and Health:

- i) One third (33.1%) of the households were in subsistence economy.
- ii) Twelve percent of persons aged 10 and above had experienced at least some form of probable general psychological distress.

6. Labour Force (15 years and above):

- i) The working age group was 25,494,490 persons (57.4% of the population).
- ii) The unemployment rate was 12.3 percent.
- iii) The share of Youth (15-24 years) Not in Employment, Education or Training (NEET) was 4,001,528 persons (42.6%).

SUSTAINABLE DEVELOPMENT GOALS

Indicator	CENSUS 2024		
	Male	Female	National
1. No Poverty			
1.4.2: Proportion of total adult population with secure tenure rights to land with legally recognized documentation	58.8	57.0	58.0
2. Zero hunger			
2.1.2 Prevalence of moderate or severe food insecurity in the population, based on the Food Insecurity Experience Scale	n/a	n/a	46
3. Good health and well-being			
3.1.1 Maternal mortality ratio ¹	n/a	207	207
3.2.1 Under-five mortality rate ²	50	41	46
3.7.2 Adolescent birth rates per 1,000 women			
a) Girls aged 10-14 years ³	n/a	0.4	n/a
b) Women aged 15-19 years ⁴	n/a	61.2	n/a
5. Gender equality			
5.b.1 Proportion of persons aged 10 and above who own a mobile telephone	46.4	40.7	43.3
6. Clean water and sanitation			
6.1.1 Proportion of the population using safely managed drinking water services ⁵	80.5	81.0	80.8
6.2.1 Proportion of population using safely managed sanitation services, including a handwashing facility with soap and water			
6.2.1a - Proportion of population using safely managed sanitation services ⁶	40.8	41.5	41.2
6.2.1b - Proportion of population with handwashing facilities with soap and water available at home	24.2	24.5	24.3
7. Affordable clean energy			
7.1.1 Proportion of population with access to electricity ⁷	53.2	54.6	53.9
7.1.2 Proportion of population with primary reliance on clean fuels and technology	3.0	2.9	3.0
8. Decent work and economic growth			
8.5.2 Unemployment rate (15 years and above)	10.5	14.2	12.3
8.6.1 Proportion of youth (15-24 years) Not in Employment, Education or Training (NEET)	37.1	47.3	42.6
10. Reduced inequalities			
10.7.4 The proportion of the population who are refugees	1.8	1.7	1.8
16. Peace, justice, and strong institutions			
16.9.1 Proportion of children under 5 years of age whose births have been registered with a civil authority ⁸	10.3	10.3	10.3
17. Partnerships for the goals			
17.8.1 Proportion of individuals using the Internet	10.6	7.6	8.9

n/a = Not applicable

¹ Expressed in terms of maternal deaths per 100,000 live births in the last 12 months prior to the census

² Expressed in terms of deaths per 1,000 live births in the last 12 months prior to the census

³ Equivalent to the age-specific fertility rate for girls age 10-14 years, expressed in terms of births per 1,000 girls age 10-14 years

⁴ Equivalent to the age-specific fertility rate for women age 15-19 years, expressed in terms of births per 1,000 women aged 15-19

⁵ Measured as the the percentage of de jure population whose main source of drinking water is a household connection (piped), public tap or standpipe, tubewell or borehole, protected dug well, protected spring, or rainwater collection.

⁶ Improved drinking water sources are those that, by nature of its construction or through active intervention, is likely to be protected from outside contamination. Improved drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development.

⁷ Measured as percentage of population using national Grid and solar for lighting

⁸ Considered age from 0-4 years registered with a birth certificate

UGANDA'S PROFILE

Census year	Population		
	Male	Female	National
1969	4,812,447	4,722,604	9,535,051
1980	6,259,837	6,376,342	12,636,179
1991	8,185,747	8,485,958	16,671,705
2002	11,824,273	12,403,024	24,227,297
2014	17,060,832	17,573,818	34,634,650
2024	22,314,289	23,591,128	45,905,417

Census Year	Average Annual Growth Rate	Sex Ratio
1969	3.9	101.9
1980	2.7	98.2
1991	2.5	96.5
2002	3.2	95.3
2014	3.0	97.1
2024	2.9	94.6

Population Type	Number of Persons/rate
Household population	44,387,526
Non-household population	1,517,891
Average household size	4.2
Population density	190 Per Sq km
Number of households	10,698,913

Total Population of Selected Age Groups	Number of Persons
Children (below 18 years)	22,750,701
Adults (18 years and above)	23,154,716
Youths (18-30 years)	10,769,151
Older persons (60+ years)	2,290,144
School age population (3-24 years)	25,163,425
Adolescents (10-19 years)	11,404,639
Women of reproductive age (15-49 years)	12,181,200

Household Population of School going Age	Number of Persons
Pre-Primary school age (3-5 years)	4,109,773
Primary school age population (6-12 years)	8,571,805
Secondary school age population (13-18 years)	6,577,331

Religion	Number of Persons
Roman Catholic	16,612,537
Anglican / Church of Uganda	13,311,801
Pentecostal / Evangelicals	6,543,196
Islam	6,051,317
Seventh Day Adventist	911,153
Orthodox	65,150
Traditional	56,332
Jehovah's witness	46,147

Other religion	704,334
No Religion	85,559

Education and Literacy	Number of Persons
Literate population aged 10+	23,181,629
Learners aged 3-5 in Pre-primary school	1,710,492
Learners in Primary school	8,926,219
Learners in Secondary school	4,571,698

Orphanhood	Number of Persons
Number of orphans (one or both parents dead)	2,873,622

Disability Prevalence (Household based) International standards	Number of Persons	Percentage
5 years and above	1,289,513	3.4
2 years and above	1,421,632	3.4

Disability Prevalence (Household based) Some difficulty included	Number of Persons	Percentage
5 years and above	5,153,649	13.6
2 years and above	5,522,588	13.2

Labour Force Characteristics International standards	Number of Persons	Percentage
Working age group (15 and above)	25,494,490	57.4
Employment to Population Ratio (15 and above)	9,653,537	37.9
Number of people unemployed (15 and above)	1,358,549	12.3
Labour Force Participation Rate (15 and above)	11,012,086	43.2
Youth Not in Employment, Education or Training (15-24years)	4,001,528	42.6

National context		
Working age group (14-64 years)	25,155,922	56.7
Employment to Population Ratio (14-64years)	9,437,965	37.5
Number of people unemployed (14-64years)	1,355,589	12.6
Labour Force Participation Rate (14-64years)	10,793,554	42.9
Youth Not in Employment, Education or Training (18-30years)	5,250,768	50.9

Fertility	Number of Persons	Rate
Total Fertility Rate (15-49years)		4.5
Crude Birth Rate (10-59years)		33.2
Adolescent who began Childbearing (10-19years)	366,606	6.5

Child marriages		Percent
Prevalence of Child Marriage (10-17years)	533,379	6.7

Mortality		
Infant Mortality Rate (per 1,000 live births)		34 deaths
Under-5 Mortality rate (per 1,000 live births)		46 deaths
Maternal Mortality Ratio (per 100,000 live births)		207 deaths
Crude death rate (per 1,000 persons)		5
Life Expectancy at birth-Total		68.2 years
Life Expectancy at birth-Male		66.9 years

Life Expectancy at birth-Female

70.1 years

Household heads	Number of households	Percent
Number of households headed by males	7,129,539	66.6
Number of households headed by females	3,569,374	33.4

Housing Tenure	Number of households	Percent
Owner occupied	7,035,853	65.8
Free	887,638	8.3
Subsidized	120,701	1.1
Rented	2,654,721	24.8

Construction Materials

Roof	Number of households	Percent
Iron sheets	7,995,297	74.7
Thatch/Dry leaves	2,183,648	20.4
Other (clay tiles, asbestos, tins etc)	519,968	4.9

Wall	Number of households	Percent
Bricks	6,495,307	60.7
Mud and pole	2,264,959	21.2
Other (Tarpaulin, wood, thatch/papyrus, iron sheets, etc)	1,938,647	18.1

Floor	Number of households	Percent
Cement screed	3,338,061	31.2
Rammed earth	2,696,126	25.2
Cow dung screed	1,989,998	18.6
Other (wood, tiles, stones, etc)	2,674,728	25.0

Source of water for drinking	Number of households	Percent
Improved water sources	8,675,473	81.1
Unimproved water sources	2,023,440	18.9

Type of Sanitation	Number of households	Percent
Improved sanitation	4,664,468	43.6
Unimproved sanitation	5,319,408	49.7
No toilet facility	715,037	6.7

Main type of cooking fuel (Only for households that cook)	Number of households	Percent
Kerosene/paraffin	83,620	0.8
Charcoal	2,882,988	28.2
Wood	6,593,910	64.5
Electricity	117,729	1.7
Biogas	107,139	1.1
Liquified Petroleum Gas	115,933	1.1
Other fuel type	262,662	2.6

Main source of energy for Lighting	Number of households	Percent
Electricity (grid and Mini grid)	2,706,626	25.3
Electricity (Solar)	3,006,732	28.1
Rechargeable flashlight, mobile torch or lantern	838,779	7.8
Dry battery cells/Battery powered flashlight, torch or lantern	1,238,507	11.6

Biogas lamp	24,851	0.2
Liquified Petroleum Gas lamp	257,486	2.4
Gasoline lamp	55,377	0.5
Kerosene/ paraffin lamp / tadooba	998,308	9.3
Candle	665,494	6.2
Open fire	552,869	5.2
Others	353,884	3.3
Percentage using clean energy for lighting	8,072,981	75.5

Household welfare	Number of households	Percent
Subsistence Economy	3,543,400	33.1
Money Economy	7,155,368	66.9
Food Secure households	5,777,413	54.0

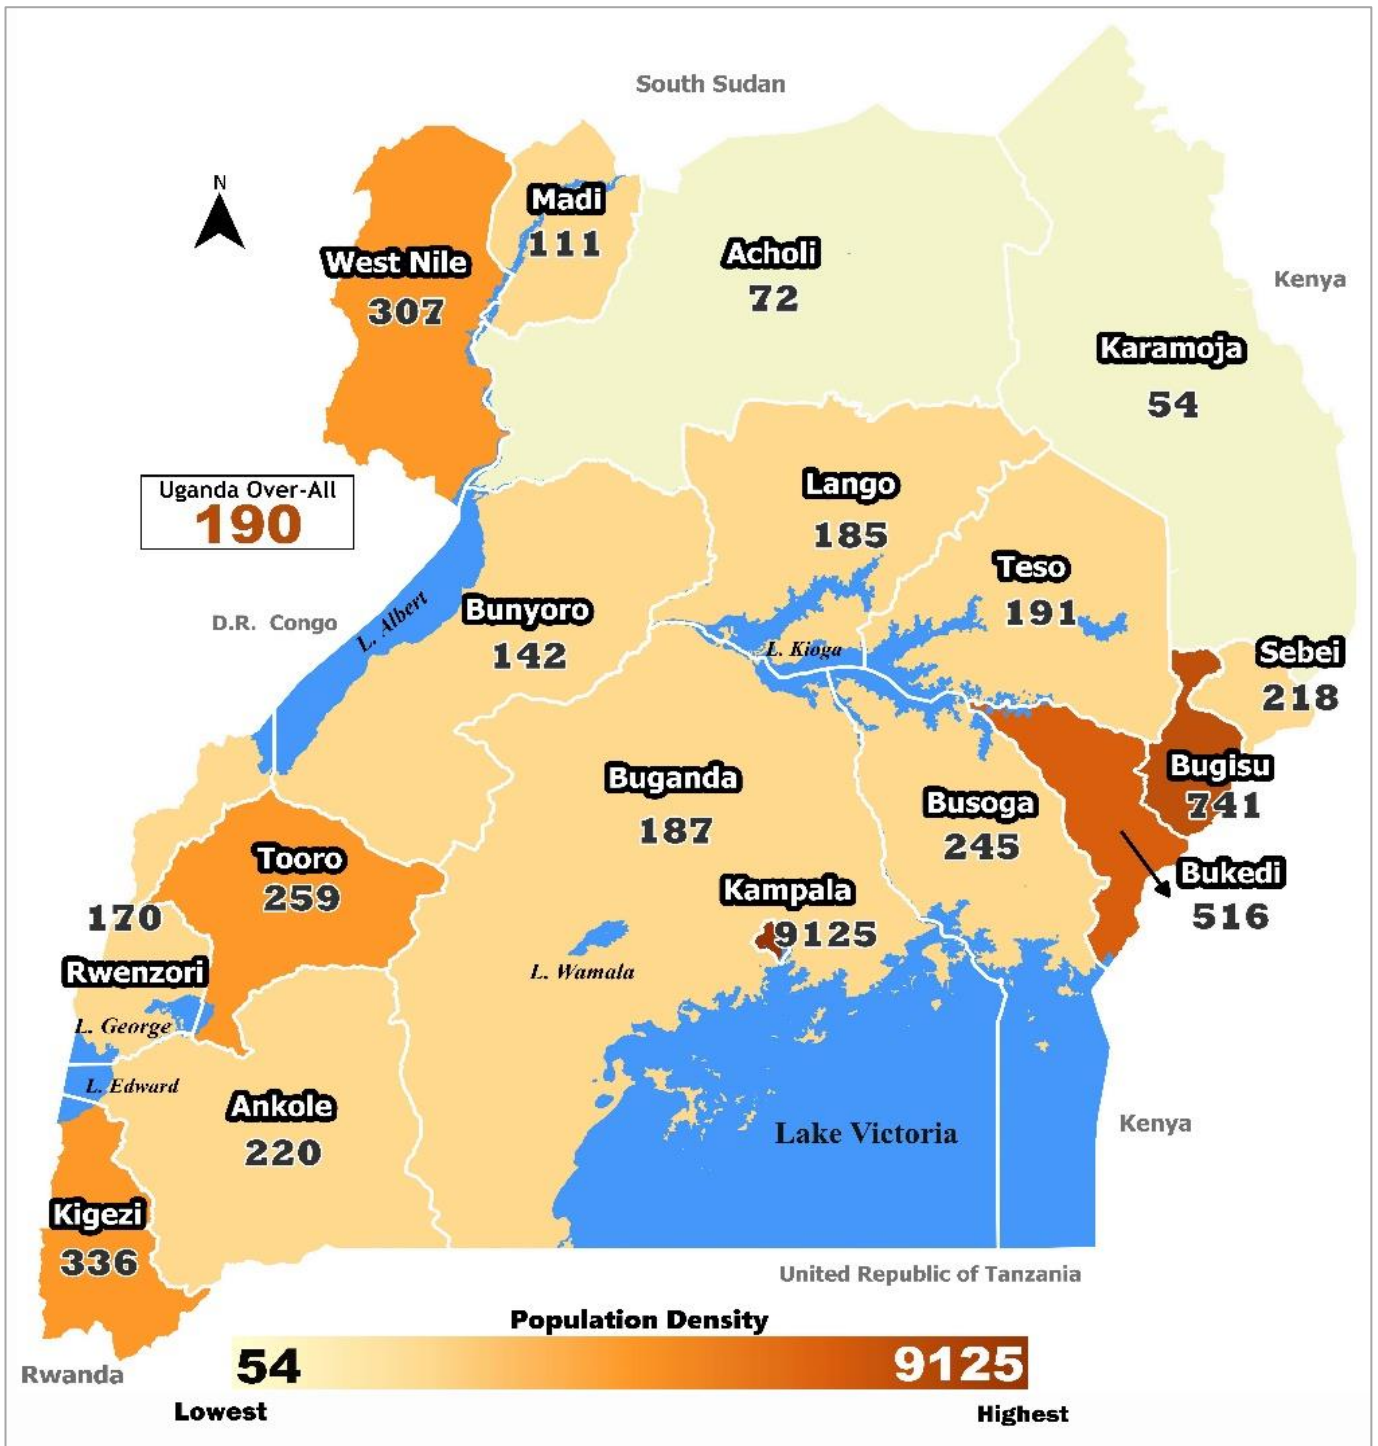

Proportion of Individuals saving (16 years and above)	Number of Persons	Percent
Formal	6,715,512	63.9
Informal	1,680,819	16.0
Keep at home/with friend	2,108,961	20.1

Ownership of Household Assets	Number of households	Percent
Owns a bicycle	2,129,197	19.9
Owns a motorcycle/scooter	1,246,319	11.7
Owns a motorvehicle	422,270	4.0
Owns a generator	101,095	0.9

Information and Communication Technology	Number of persons	Percent
Mobile phone ownership (10 years and above)	31,389,721	43.3
Fixed phone ownership	887,789	8.3
Computer use (last 30 days)	1,224,199	3.9
Internet usage	2,809,327	8.9
Use of online Government services	639,188	2.0

Sources of Information	Number of Households	Percent
Radio	4,101,947	38.3
Word of Mouth	2,296,387	21.5
Phone Calls	1,591,177	14.9
Television	1,510,829	14.1
Community Meetings	320,592	3.0
Social media	249,940	2.3
Community Announcer	451,469	4.2
Community Barazas	52,004	0.5

The National Population and Housing Census 2024 (NPHC 2024) was designed and implemented to provide reliable and accurate statistical data for evidence-based planning and decision making, to support the implementation and tracking of progress and achievement of National and International Development Frameworks including; the National Development Plans (NDPs), East African Community Vision 2050, Africa Agenda 2063 and 2030 Agenda for Sustainable Development (SDGs).

A population census is the total process of planning, collecting, compiling, evaluating, analysing and disseminating demographic, economic and social data at the smallest geographic level pertaining, at a specified time, to all persons in a country.

A housing census is the total process of planning, collecting, compiling, evaluating, analysing and disseminating statistical data relating to the number and condition of housing units and facilities as available to the households pertaining, at a specified time, to all living quarters and occupants thereof in a country or in a well-delimited part of a country

Source: Principles and Recommendations for Population and Housing Censuses, Revision 3 of 2017

The NPHC 2024 combined both the population and housing census.

Population and Housing Censuses are the Government's largest peacetime and logistically demanding statistical undertakings world-wide. The National Population and Housing Census 2024 is the eleventh in the series of Censuses Uganda has conducted, six (6) of which were conducted in the post-independence period. Population counts were conducted in 1911, 1921 and 1931, while scientific Censuses were conducted from 1948 to date. The African and non-African populations were enumerated separately in 1948 and 1959. During the post-independence period, Population Censuses were conducted in 1969, 1980, 1991, 2002, 2014 and 2024. These were national in nature with both Ugandan and non-Ugandan populations being enumerated simultaneously. The NPHC 2024 conducted during the period 10th – 26th May 2024, is the first digital census conducted in Uganda.

1.1 Legal framework

The Uganda Bureau of Statistics (UBOS) Act, 1998 CAP 333 Laws of Uganda 2024 provides the legal authority for conducting a Census. It stipulates that, "the Minister responsible for statistics shall direct that a census be undertaken. In line with Section 13 (1) and (2) of the UBOS Act CAP 333, the Minister of State for Finance, Planning and Economic Development (Planning) issued Statutory Instrument No.15 of 2024 directing that a Census be undertaken for enumeration of population and housing with the night of 9th May 2024 as the Census reference night. One of the main Fundamental Principles of Official Statistics is ensuring confidentiality of the data collected and this is further stipulated in Section 19 of the Act. Consequently, all field officers swore the Oath of Secrecy administered by or on behalf of Executive Director and Chief Magistrate. This formed the legal basis for undertaking the NPHC 2024 and adherence to data privacy and protection protocols.

1.2 Objectives

The main objective of the NPHC 2024 was to generate bench-mark statistical data to inform planning processes at national and lower levels.

The specific objectives were:

- i) To ascertain size, structure and distribution of the population
- ii) To gather data on housing conditions and access to basic services
- iii) To monitor changes in key social and economic indicators since the previous Census
- iv) To update census maps and lists of Enumeration Areas for effective execution of the census, construction of efficient area sampling frames for subsequent surveys and geographical maps at the lowest level.
- v) To establish the statistical infrastructure for future operations at the lowest Local Government level.
- vi) To further enhance the capacity of UBOS staff to undertake future censuses and large-scale sample surveys.
- vii) Inform policies and programmes aimed at improving the quality of life of all Ugandans

1.3 Organisation of the census

The Governance structure for the NPHC 2024 was comprised of the Cabinet Sub Committee named National Census Council (NCC), as the apex body, chaired by the Rt. Honorable Prime Minister. Next to the NCC was the National Steering Committee, chaired by the Permanent Secretary / Secretary to the Treasury, the UBOS Board of Directors and the Census Management Team. The structure also comprised other Committees at District/City level and lower LGs.

The Census Commissioner was the head of operational and technical matters of the NPHC 2024. The NPHC 2024 activities were carried out in the Districts, Cities and Special areas. District/City/Special Area Census Committees were constituted for all the 135 districts, 11 cities, and Special Areas. These committees were headed by the Chief Administrative Officer (CAO)/ City Town Clerk (CTC) /Special area Accounting Officers and comprised the District/City/Special Area Census Officer (D/CCO), Assistant District/City/Special Area Census Officer (AD/CCO), District/City/Special Area Information Technology Officer (D/CITO), and District/City/Special Area Publicity Officer (D/CPO). Special areas were Uganda Prisons Service (UPS), Uganda Police Force (UPF), Uganda People's Defense Forces (UPDF), Diplomatic Missions, Uganda Wildlife Authority (UWA) camps and Refugee Settlements.

Depending on the size of each District/City/Special Area, District/City/Special Area Representatives of the Census Commissioner (D/CCR) comprising staff from UBOS, National Population Council and Academia (Makerere University and Kyambogo University) were assigned the role of overseeing the entire NPHC 2024 activities at the District/City/Special Area level.

1.4 Census Implementation

1.4.1 The Pre-Enumeration Phase

1.4.1.1 Census Mapping

Census mapping is the process of delineating the country into enumeration areas to facilitate smooth enumeration of the population. A well implemented mapping is considered pivotal for the success of the Census. Census Mapping was undertaken between May 2021 and April 2024. This was aimed at obtaining digitized Enumeration Areas (EAs), updated geography lists and an infrastructure database. The specific objectives of the Census mapping were:

- i) To produce digitized area maps for use during the enumeration exercise.

- ii) To generate information for use in planning for the NPHC 2024 enumeration such as estimation of quantity and distribution of human resource and enumeration materials at all planning levels.

1.4.1.2 Census sub Regions

At the time the NPHC 2024 was conducted, Uganda was divided administratively into 135 districts and 11 cities. The Census analysis is based on the 17 sub Region groupings as classified in the First Schedule of the 1995 Constitution of the Republic of Uganda. The sub Regional composition of the districts and cities are the following (**Figure 1.1**);

- i. **Kampala:** Kampala Capital City
- ii. **Buganda:** Bukomansimbi, Butambala, Gomba, Kalangala, Kalungu, Kyotera, Lwengo, Lyantonde, Masaka, Masaka City, Mpigi, Rakai, Sembabule, Wakiso Buikwe, Buvuma, Kassanda, Kayunga, Kiboga, Kyankwanzi, Luwero, Mityana, Mubende, Mukono, Nakaseke, Nakasongola.
- iii. **Busoga:** Bugiri, Bugweri, Buyende, Iganga, Jinja, Jinja City, Kaliro, Kamuli, Luuka, Mayuge, Namayingo, Namutumba.
- iv. **Bukedi:** Budaka, Busia, Butaleja, Butebo, Kibuku, Pallisa, Tororo.
- v. **Bugisu:** Bududa, Bulambuli, Manafwa, Mbale, Mbale City, Namisindwa, Sironko.
- vi. **Sebei:** Bukwo, Kapchorwa, Kween.
- vii. **Teso:** Amuria, Bukedea, Kaberamaido, Kalaki, Kapelebyong, Katakwi, Kumi, Ngora, Serere, Soroti, Soroti City.
- viii. **Karamoja:** Abim, Amudat, Kaabong, Karenga, Kotido, Moroto, Nabilatuk, Nakapiripirit, Napak
- ix. **Lango:** Alebtong, Amolatar, Apac, Dokolo, Kole, Kwania, Lira, Lira City, Otuke, Oyam
- x. **Acholi:** Agago, Amuru, Gulu, Gulu City, Kitgum, Lamwo, Nwoya, Omoro, Pader
- xi. **West Nile:** Arua, Arua City, Koboko, Madi Okollo, Maracha, Nebbi, Pakwach, Terego, Yumbe, Zombo
- xii. **Madi:** Adjumani, Moyo, Obongi
- xiii. **Bunyoro:** Buliisa, Hoima, Hoima City, Kagadi, Kakumiro, Kibaale, Kikuube, Kiryandongo, Masindi
- xiv. **Tooro:** Bunyangabu, Fort Portal City, Kabarole, Kamwenge, Kitagwenda, Kyegegwa, Kyenjojo,
- xv. **Rwenzori:** Kasese, Ntoroko, Bundibugyo
- xvi. **Kigezi:** Kabale, Kanungu, Kisoro, Rubanda, Rukiga, Rukungiri
- xvii. **Ankole:** Buhweju, Bushenyi, Ibanda, Isingiro, Kazo, Kiruhura, Mbarara, Mbarara City, Mitooma, Ntungamo, Rubirizi, Rwampara, Sheema

Figure 1.1: Map of Uganda showing sub Regions, Districts and Cities, 2024

1.4.1.3 Development of Tools

The process of designing appropriate documents to elicit the required information from respondents is an effective stage in preparation for data collection. Consultative meetings were organized to collect views on the data requirements from various categories of data users notably Central Government, Local Governments (LGs), Civil Society Organisations (CSOs), Cultural and Religious Institutions, Development Partners and Academia.

Arising from the consultations, the tabulation plan was developed which guided the finalization of five (5) census questionnaires namely; Household Questionnaire, Institutions Questionnaire, Floating Population Questionnaire, Accommodation (Hotel) Questionnaire and Community Questionnaire and their respective manuals.

The questionnaires were designed to collect information on a wide range of individual, household and community characteristics. To ensure data quality, editing checks were embedded in the questionnaires. The Census and Survey Processing System (CSPPro) application was programmed with clear skip patterns, validation rules were developed and embedded in the data capture application to avoid errors at data collection stage. The application included mandatory fields of age, date of birth and sex of the individual.

The household questionnaire was translated into 20 local languages namely, Rukonzo, Luganda, Lubwisi, Rufumbira, Runyankore/Rukiga, Runyoro/Rutoro, Swahili, Ateso, Jhopadhola, Kakwa, Kupsabiny, Acholi, Langi, Lugbara, Lumasaba, Lusamia, Lusoga, Madi, Alur and Ngakarimojong.

The NPHC 2024 slightly differs from the previous census in a number of ways;

- i) Over the years, there have been improvements in methodologies in statistical processes such as classification of functional disability, international classification of labour standards, youth and groupings of indigenous communities in Uganda.
- ii) At the national level, there have been policy changes in the way the country classifies population groups such as persons with disability, age for Youth (18-30 years) and working age group 14-64 years.
- iii) Based on the emerging data demands, there have been new areas that the NPHC 2024 covered not in the previous censuses such as mental health, food security, energy, waste management and emigration.

Due to (i) – (iii) above, modifications were made to the questionnaires and the tabulation plan to address the changes that meet the current data demands. Where the classifications differ from those of NPHC 2014, the report has aligned the results. For example, in NPHC 2014; (a) the indigenous grouping “Other Ugandan” is classified as “Tribe not stated” in NPHC 2024 Report, (b) Persons with disability have been reported in adherence to international standards, and (c) two sets of working age and youth age group have been reported where one is adhering to the international guidelines and the other to the national practices.

1.4.1.4 Pretest

Pretests were undertaken to assess the suitability, adequacy, completeness of questions, as well as language and understanding by the respondent. The pretests were carried out in selected enumeration areas in Wakiso, Kampala Capital City and Butambala.

1.4.1.5 Pilot Census

The Pilot Census was conducted to test the Census processes and procedures to achieve adequate preparedness for the NPHC 2024. The exercise was conducted in two phases; Phase one was conducted in June 2023 and phase two in August 2023. Phase one covered 12 districts namely, Bunyangabu, Buliisa, Kole, Kotido, Koboko, Omoro, Tororo, Serere, Namayingo, Nakasongola, Kisoro, Buhweju and Mbale City. Phase two covered Greater Kampala Metropolitan Area comprising Kampala Capital City, Mukono and Wakiso Districts. The findings of the pilot exercise informed the necessary improvements that enabled UBOS to successfully implement NPHC 2024.

1.4.1.6 ICT Infrastructure

To facilitate the implementation of the maiden digital Census, the Bureau established an enabling ICT environment comprising of; 121,240 handheld electronic devices (tablets), servers (data storage, processing and backup), MTN and Airtel Access Point Name (APN) cards, and a data processing centre where the tablets were provisioned, processing and analysis were undertaken. A multilayer firewall was installed to provide for protection of data from Cyber-attack during data transmission from the field to the central data processing and storage servers. A software was deployed to restrict access to the server allowing for only authorised users in addition to data encryption for integrity and confidentiality of individual information.

Provisioning of Tablets included installing the Census and Survey Processing System (CSPro) for data collection, Enumeration Area Maps, Manuals and workload assignment software to enumerators.

1.4.1.7 Recruitment, Training and Capacity Building

The CAO/CTC/Special area Supervisors nominated the respective D/CCOs, AD/CCOs, D/CITOs, D/CPO and Subcounty/Division Supervisors. The Enumeration Supervisors and Enumerators were directly recruited by their respective CAOs/CTC/Special Area supervisors with support from their respective Human Resource Departments mainly using the UBOS e-recruitment system in line with the NPHC 2024 recruitment guidelines. Exceptions were allowed to those who could not meet the strict qualification guidelines whereby Districts/Cities would submit in bulk recruited personnel outside the e-recruitment system.

All NPHC 2024 staff underwent mandatory training on Census concepts and procedures to ensure mastery and transfer or application of the skills and knowledge for conducting the digital census. The training was conducted in 4 tiers, cascaded as follows:

- Tier I was the Training of Trainers (ToT) comprised of UBOS staff and representatives from stakeholders. These trained Tier II participants and supported the training and monitoring of Tier III and IV.
- Tier II training comprised District/City/Special area level Supervisors in a nine-day workshop at Speke Resort Hotel Munyonyo, who later trained Tier III participants. The Trainees were split into ten classes by sub Region, and these were run concurrently.
- Tier III involved training of the Sub County/Division level Supervisors by the District/City/Special area level Supervisors in a nine-day training workshop held at venues within the District/City/Special area. These trained the Tier IV participants.
- Tier IV, the final stage involved training of Enumeration Supervisors and Enumerators in a nine-day non-residential training held at venues within the Sub County/ Division/ Special areas.

The number of trainees per class was limited to a maximum of 70 people to enhance the quality of the training. Classes bigger than the maximum were split and extra trainers provided. The following materials were provided to aid the training;

- i) Electronic copies of the training materials. These included PowerPoint presentations on all topics, manuals, questionnaires, training videos and a photo gallery in the manual, on key concepts such as housing characteristics, water sources, types of functional difficulties, agricultural crops, economic activities, among others. Both the CAPI application and questionnaires were linked to the manual for reference as and when guidance was needed.
- ii) Hard copy training materials were also provided and these included; training manuals, attendance lists, registration forms, CAPI distribution forms among other things.
- iii) An online interactive platform (Slido) was used for handling question-and-answer sessions at all training levels.. This eased communication and provided timely response or feedback on any emerging issues during training. This was complemented by the various WhatsApp groups created at various levels.
- iv) Monitoring and Evaluation was conducted at all training levels to establish understanding of the Census concepts and inform areas that needed to be emphasised during recap. This was managed electronically through administering daily assessment tools to all trainers and trainees using the Mentimeter software package.

1.4.1.8 Advocacy and Publicity

Successful implementation of the census depends on stakeholder awareness and engagement. Thus, the NPHC 2024 advocacy and publicity campaigns played a vital role in preparing the public for active cooperation and participation during the exercise. These started with the launch of the NPHC 2024 by His Excellency the President of the Republic of Uganda on 12th December 2023, at which he encouraged everyone to participate in the Census. This officially flagged off the NPHC 2024 activities countrywide as championed by the National Census Council and District/City/Special area Census Committees.

To enhance massive publicity for the census, various promotional contents were frequently published in print, online, and electronic media. In addition, Census activities were regularly published on social media such as Facebook, WhatsApp, Twitter, YouTube, Instagram among others. The Countdown time to the Census was also frequently advertised in the print media.

1.4.2 The Enumeration Phase

The modalities of the enumeration phase included the following:

1. The Census Reference Night was the night of 9th May 2024. The enumeration was done on a de facto basis i.e. every person was enumerated where he/she spent the Census Reference Night.
2. Identification of the enumeration areas using digital maps was based on the Global Positioning System (GPS) location.
3. The enumeration started on 10th May and continued to 19th May 2024. However, in some areas of Greater Kampala Metropolitan Area and some districts that started late, an extra seven (7) days (20th – 26th May) were added to complete the enumeration exercise.
4. The enumeration process was a door-to-door exercise, using tablets loaded with the Computer Assisted Personal Interview (CAPI) application. The field management processes, including monitoring of data, field staff performance and other quality control processes were also automated.
5. Access to the enumeration application was by use of login credentials generated through the e-recruitment system.
6. Trained enumerators moved from door-to-door within the assigned parish/ward and administered the questionnaire to the Head of household or any other knowledgeable household member. The enumerators also visited the respective institutions and accommodation facilities within the parish/ward while enumerating the population.
7. Special arrangements were made to enumerate the institution and floating populations, as well as guests in accommodation facilities. The floating population was enumerated on the night of 9th May 2024.
8. Phone numbers of selected Census staff were circulated to all Higher Local Governments to provide quick solutions to various problems arising at the field level during data collection and to ensure direct interaction between Bureau staff and the public.
9. Supervision areas for IT and Data Management staff were created. UBOS deployed IT staff to manage the sub Regions by supporting all the CCRs and District/City/Special area staff.

10. During enumeration, upon completion of an interview, the enumerators would immediately send data directly (synchronize) to the server, from their tablets. The data was downloaded daily for all questionnaires. A Network Operations Centre (NOC), referred to as a situation room, was set up for real-time monitoring of the progress on data collection, and to monitor the daily spatial coverage. This played a significant role in ensuring data quality and coverage. The use of digital equipment through which each enumerator synchronized data straight to the head office, eliminated the data entry and preliminary editing processes, and facilitated timely compilation of the preliminary results.

1.4.3 The Post-Enumeration Phase

The post-enumeration activities that were conducted included retrieval of electronic devices from the field, data processing, analysis and dissemination of the preliminary and provisional reports. Other products will include census maps/atlas, dissemination board showing district/city, constituency, subcounty, parish and village profiles.

1.4.3.1 Data Processing and Analysis

A set of data editing guidelines was finalised by the subject matter specialists. An editing programme using CSPro was developed. Testing of the editing process was undertaken using a sample data set. Discussions were conducted with the subject matter specialists to guide the process of testing and checking the consistency and validity of data in the tables. The Census 2024 results were analysed using STATA18 and quality control was done using CSPro. The analysis from Chapters four to 20 is based on information collected from households as detailed data and information on personal characteristics were not collected in non-household population.

The analysis followed international best practices to provide for international comparison and also present statistics for national context, where applicable.

1.4.4 Quality Control and Assurance

Comprehensive quality assurance was conducted across all the census phases to ensure production of quality data and statistics, in line with the data quality dimensions of, relevance, methodological soundness, accuracy, timeliness, accessibility, coherence and comparability. In addition, the institutional environment within which NPHC 2024 would be conducted, was continuously assessed to ascertain that the resources (human, financial and technological) available were sufficient to produce quality statistics.

During tools development (questionnaires), independent reviews were made to include the various needs of the different development frameworks, policies and strategies at both national, regional and international levels. In addition, these tools including the various Census software were tested and re-tested to ascertain proper functionality before they were deployed for use. These included the questionnaires, interactive Enumeration Areas maps, e-recruitment system, stress testing of the servers (processing and storage), among others. Further, the tablets and all the supporting systems for data collections including functionality, data transfer and management procedures and protocols were also tested.

To enhance the quality of data from the field, the in-built data editing checks were developed and implemented. The households and facilities were geo-referenced, enabling effective monitoring of field coverage as Census data was being captured. The data processing and analysis was quality-assured using the data-editing guidelines, and tabulation plan, in addition to validation of draft tables and reports by peer reviewers..

1.4.4.1 The Myers' Blended Index and UN Joint Score test

Two indices were computed to ascertain the reliability of census data in line with UN recommendations for undertaking and validating census data reliability. These included the Myers' Blended Index and the UN Joint Score test.

- a) The Myers' Blended Index is used to measure age preference or avoidance across all the ten digits. The index evaluates census data reliability to detect any likely age misreporting and aids accurate analysis. It compares observed age frequencies for each final digit (0-9) to an expected even distribution and quantifies deviations from perfect reporting.
- b) The UN Joint Score Index is a metric that measures the accuracy of a population age and sex structure. The index was used to test census data reliability using age and sex of the respondent. If the score is under 20 the data is reasonably reliable; between 20 and 40 the data is fairly reliable; over 40 the data is unreliable.

The Myers' Blended Index results show that the preferences for age digits 0 - 9 were less than two (2) implying quality data (Figure 1.2). The Figure 1.2 indicates that unlike the NPHC 2014 , people tended to mention their exact age rather than approximating to the nearest zero or five.

Figure 1.2: Myer's Blended Index of Age Preference

The UN Joint Score Index was computed and revealed an index of about 26.79 which means that the NPHC 2024 data on age and sex is usable (**Figure 1.3**).

Figure 1.3: UN Joint Score

1.4.5 Dissemination of Census Results

The NPHC 2024 Reports were released in phases. The Preliminary Report was released on 27th June 2024, a month after the end of the data collection exercise on 26th May 2024. It provided population counts, disaggregated by sex, at national, regional, and district levels.

The NPHC 2024 Provisional Report was released on 3rd October 2024, four (4) months following the end of the data collection exercise on 26th May 2024.

The timely dissemination of these findings was made possible by the digital census, which enhanced the data entry and preliminary editing processes. In addition, a fully equipped data center established at the Bureau offices, both in Entebbe and at Head Office, and resourced by highly technical personnel ensured timely delivery of the report.

Other post-enumeration activities to be conducted include production of thematic reports, District and Constituency profiles, and many other Census products.

1.4.6 Risks and Mitigation measures

The Bureau identified and analyzed key risks associated with the undertaking of the NHPC 2024. Being the first digital census, a number of risks were anticipated covering technologically related risks in areas of census planning, training and enumeration. Other risks anticipated were delayed procurement of census items including tablets and software, resistance from the public, disinformation, head of household not being present at the time of enumeration, internal border conflicts and climate change related risks.

The risks that materialized during the implementation of the NPHC 2024 and the mitigation measures instituted were:

- a) Delay in the procurement of Census tablets, software and Servers due to delayed appropriation of funds resulting into late delivery and provisioning of the tablets for NPHC 2024. To mitigate the effects of this risk, the Bureau engaged the suppliers to deliver in batches whatever was manufactured as provisioning was being done. This enabled training of trainers, supervisors, and enumeration teams to begin on time. The distribution of tablets to the Local Governments was done in such a way that whatever was ready was promptly dispatched before the census night. A temporary and secure cloud server was internally developed to mitigate the late deployment of the hyper-converged server environment to receive the data from the enumerators.
- b) Limited skill by enumerators to use tablets during data collection. This was mitigated by implementing a four-tier training program to National Trainers, Training of Trainers for district/city officials at national level, Training of Trainers for Sub County/Municipalities/Town Councils at higher Local Government level and Training of enumeration supervisors and enumerators at Sub County/Town Council level. This enhanced skill transfer to all census staff on use of tablets. In addition, there was strengthened supervision, Monitoring and Evaluation during training and enumeration.
- c) Non-adherence to the recruitment guidelines by Local Governments and hiring enumeration staff outside the designed e-recruitment system. Those recruited outside the system had login difficulties, hence delayed commencement of enumeration in some areas. This risk was mitigated by uploading the affected census workers into the system after being identified by their local authorities with support from the District/City Census Commissioner Representatives and M&E staff from headquarters deployed in various jurisdictions.
- d) Some enumerators failing to log in at commencement of enumeration due to delayed assignment of tasks by the Local Government authorities. This risk materialized in Greater Kampala and a few other urban areas. The Bureau mitigated the risk by creating temporary village logins to enable completion of task assignment. By the end of the third day the risk had been eliminated.
- e) Difficulty in accessing single-person households, gated households in urban areas, hard-to-reach places such as islands, mountainous areas, landslide and flood prone areas, slowing the pace of enumeration. This risk was mitigated by Cabinet granting permission to UBOS to extend the enumeration period by six days to enable every household in the country to be counted, increased publicity, continuously engaging Local Council 1 (LC1) leadership and deployment of specialized enumerators from headquarters to augment the existing ones. The determination and patriotism of enumerators in these areas enabled successful conclusion of enumeration exercise.
- f) Internal border conflicts delaying/derailing enumeration. The affected areas included; (i) Akaa conflict between Amuru and Adjumani Districts), (ii) Pararo oroko area between Amuru and Gulu Districts, (iii) Ombechi/Kochi Legu/Romogi, Gburule/Romogi (conflict between Yumbe and Obongi districts, and (iv) Nyamisingiri between Kabarole and Ntoroko Districts. This risk was mitigated by holding joint meetings with district leaders and deployment of security forces to enable enumeration the affected areas.
- g) Internal/external sabotage to fail the Census enumeration exercise. This risk materialized mainly in Greater Kampala Metropolitan Area (GKMA) and other cities, where enumerators were being discouraged from undertaking enumeration effectively. The risk was mitigated by deploying special enumeration teams to cover every household and re-interviewing some households to achieve completeness in affected areas during the enumeration period.
- h) Religious cults resisting being enumerated and encouraging their followers. This risk occurred mostly in Alebtong, Bugiri, Bugweri, Iganga, Kamuli, Luweero, Mayuge and Sironko districts. Intense sensitization and use of Police to arrest the perpetrators mitigated the risk.

- i) Head of household not present at the time of enumeration. This risk materialised when some household heads waited in vain for the enumerators on the first day. The risk was mitigated by interviewing any responsible adult person identified in the household where the household head was not found at home.

1.4.7 The Post-Enumeration Survey

A Post Enumeration Survey (PES) was conducted by an independent team of experts during the month of August 2024, covering 1,000 Enumeration Areas (EAs). The objective of the PES was to measure the coverage errors and content of the NPHC 2024 as a technical validation process. The PES results revealed a net coverage of 95.7%. This information will be used to project the population for December 2024 and subsequent years until the next National Population and Housing Census.

1.4.8 Structure of the Main Report

The remainder of the Main Report contains 20 Chapters namely; Chapter 2: Population Size; Distribution and Density; Chapter 3: Population Characteristics; Chapter 4: Education and Literacy; Chapter 5: Information and Communication Technology; Chapter 6: Selected Health Characteristics; Chapter 7: Fertility; Chapter 8: Mortality; Chapter 9: Migration and Forced Displacements; Chapter 10: Labour Force Characteristics; Chapter 11: Household and Housing Characteristics; Chapter 12: Government Programmes; Subsistence Economy and Household Welfare; Chapter 13: Access to and Usage of Financial Services; Chapter 14: Household Waste Management; Chapter 15: Disability; Chapter 16: Characteristics of Children; Chapter 17: Characteristics of Adolescents and Youth; Chapter 18: Characteristics of Older Persons; Chapter 19: Agriculture; Chapter 20: Food Security; and Chapter 21: Recommendations.

Key Findings

- **Total Population in May 2024** was 45,905,417 persons of which 22,314,289 are males and 23,591,128 females.
- **Average Annual Population growth rate** declined from 3.0 percent in 2014 to 2.9 percent in 2024.
- **Population density** was 190 persons per square kilometer in 2024.
- **Daytime population in cities** was 5,547,645 persons. Kampala Capital City had the highest daytime population of 2,503,174 persons while Fort Portal city recorded the lowest figure of 176,994 persons.

This chapter presents information on the country’s population size and distribution based on the NPHC 2024 and trends incorporated from previous censuses.

Information about the country’s population size, growth and distribution are critical statistics that enable governments to make informed decisions, plan effectively and monitor development initiatives. Thus, a good understanding of the population trends and distribution is essential in assessing development and service delivery.

2.1 Total Population

There is a steady increase in population size over the years. The total population of Uganda was 45,905,417 persons in 2024, an increase of 11,270,767 persons from 34,634,650 persons registered in 2014 (**Figure 2.1**).

Figure 2.1: Total Population by Census Year, 1948 – 2024

The results on the sex composition of the population show that there were more females (23,591,128) than males (22,314,289) in 2024. A similar pattern is observed for previous censuses except for 1948, 1959 and 1969 (**Figure 2.2**).

Figure 2.2: Sex Composition of the Population (million): 1948-2024

Intercensal growth rate measures the average change in the population size between two years. There has been a decline in the average annual population growth rate from 3.0 percent between 2002 and 2014 to 2.9 percent between 2014 and 2024 (**Figure 2.3 and Table 2.2**).

Figure 2.3: Population Intercensal Growth Rates, 1948-2024

2.2 Age and Sex Composition

Age and sex are two attributes which are valuable for understanding the current state of the population and they influence an individual's role in society. They are the basic characteristics or biological elements of any demographic group which influence fertility, mortality, migration, marital status and economic activity status among other characteristics.

Age specific data is therefore important for predicting future demographic, social and economic trends to inform age and sex specific policies and programmes.

2.2.1 Age Distribution

Age data is fundamental to majority of the characteristics collected in the Census. The age distribution is the proportional number of persons in successive age categories of a population. It reflects the past fertility and mortality behaviour of the population. In the absence of high migration or drastic changes in births and deaths, the younger population groups are expected to be more than the older ones. The NPHC 2024 results indicate that the younger population constitutes the highest percentages for both males and females (Table 2.3A and Table 2.3B).

Figure 2.4: Population Pyramid

A population pyramid is a graphical presentation of age and Sex composition of a population. These age groups are arranged in five-year intervals except for the age group 85+ which includes all persons aged 85 years and above.

Uganda's population is largely young as shown by the broad base of the pyramid (Figure 2.4). The population pyramid is symmetrical, indicating a relatively balanced distribution of males and females across most age groups. The narrow peak shows that there are fewer individuals in the older ages.

2.3 Sex ratio

The sex ratio of Uganda was calculated by dividing the number of males by the number of females in each region. A ratio of 100 indicates an equal number of males and females, while a ratio below 100 indicates more females than males and a ratio above 100 indicates more males than females. Figure 2.5 shows that overall, Uganda's sex ratio is 94.6, which depicts that there are more females than males. The figure further illustrates the trends in sex ratios (number of males per 100 females) in Uganda over the census years (1980 to 2024). The graph demonstrates a steady decline in the sex ratio for the total population from 98.2 in 1980 to 94.6 in 2024.

Figure 2.5: Trends in Sex Ratio in Uganda, 1980 – 2024

2.4 Dependency Ratio

The dependency ratio is an **age-population ratio of those not in the working Age group** (the dependent persons aged 0 to 14 and 65+) **to those in the working Age group** (15-64). The age dependency ratio is an indicator of the economic burden that the productive population must bear.

A low dependency ratio is desirable, as it indicates that the working age population can easily support the dependent population.

The age dependency ratio was 83.8 meaning that for every 100 working age persons there were 84 age-dependent persons.

The findings further show that 78 out of the 84 dependents were children. A high child dependency ratio of 77.7 suggests that a significant portion of the population is dependant on those in working age. The ratio of older persons to the working age, also known as the old-age dependency ratio was 6.1 (Figure 2.6).

Figure 2.6: Age Dependency Ratio

2.5 Population Distribution

Population Distribution refers to the way people are spread over a specific geographical area. It provides information on the number of individuals living in different parts of the area and this helps to understand the patterns of settlement.

Buganda sub Region had the highest population of 11,171,924 people. Sebei sub Region had the lowest population of 377,294 (**Figure 2.7 and Table 2.1**).

Wakiso district was the most populated with 3,411,177 people while Kalangala was the least populated district with 74,411 people (**Table 2.4A**).

Figure 2.7 Population Distribution by sub Region

2.6 Household and Non-household Population

A household consists of a person or group of persons, related or unrelated, who live together in the same dwelling unit and eat together. Households are the centre of demographic, social and economic processes. Decisions about childbearing, education, health care, consumption, labour force participation, migration, accessing financial intermediaries, among others, occur at the household level. Understanding the patterns of household size and consumption can inform efforts towards the achievement of national and international development agenda. On the other hand, the non-household population is comprised of people who were enumerated in institutions, hotels, streets, employment camps, diplomatic residences and persons in transit.

2.6.1 Household Population and Average Household Size

Average household size is the ratio of the total population to the total number of households in an area (The UBOS, 2015 - Uganda Statistical metadata dictionary).

Household Population

Majority of the total population (44,387,526 persons) were living in households by the time of enumeration (Table 2.5).

Average Household Size

A total of 10,698,913 households were enumerated in the NPHC 2024. This translates into an average household size of 4.2 persons, a decline from 4.7 persons in 2014 (Figure 2.8 and Table 2.6).

Figure 2.8 : Trend in Average Household Size

2.6.2 Non-household Population

This population, that did not stay in households on 9 May 2024, was enumerated using institution questionnaires A and B, and hotel questionnaire. Institutional questionnaire B and hotel questionnaire collected data on name, sex, age, date of birth, place of birth, asylum/refugee status (with a skip for diplomats) and education attainment while institutional questionnaire A collected data on all personal characteristics. The total non-household population was 1,517,891 persons.

2.7 Population Density

Population density is a measure of the degree of population concentration in an area (UBOS, 2015 - Uganda Statistical metadata dictionary). It is derived as a ratio of the total population of a given area to the total land area expressed in square kilometers. Uganda's total land area is 241,553 km².

Figure 2.9: Population Density (Population per square kilometer), 1948 – 2024

The population density of Uganda according to NPHC 2024 was 190 persons per square kilometer. There has been an increase in population density across the census years since 1948 from 25 to 190 persons per square kilometer in 2024 (**Figure 2.9**).

2.8 Daytime Population in the Cities

Daytime population includes persons who visited the cities during the day and those who spent the census night in the city. **Table 2.7** shows that the total daytime population across the eleven cities of Uganda was 5,547,645 persons. Kampala Capital City had the highest daytime population of 2,503,174 persons and Fort Portal had the lowest daytime population of 176,994 persons.

List of Tables

For more information on population size, distribution and density, see the tables below and Annex 2 Tables A1A to A4C:

- Table 2.1: Defacto Population Distribution by sub Region
- Table 2.2: Trend in Population Size and Growth Rate (1948-2024)
- Table 2.3A: Total Population by five-year Age Group and Sex
- Table 2.3B: Total Population by Special Age Group and Sex
- Table 2.3C: Household population by Special Age Group and Sex
- Table 2.4A: Total Population in Central Region by District and City
- Table 2.4B: Total Population in Eastern Region by District and City
- Table 2.4C: Total Population in Northern Region by District and City
- Table 2.4D: Total Population in Western Region by District and City
- Table 2.5: Household and Non-Household Population Type by sub Region
- Table 2.6: Number of Households and Average Household Size by sub Region
- Table 2.7: Daytime Population in Cities

POPULATION CHARACTERISTICS

Key Findings

- **Religion:** Total household population was dominated by Christians (81.7%) and Islamic faith (13.2%).
- **Marriage:** Five in every ten persons (50.6%) aged 18 years and above were married while one in every four persons (26.6%) were cohabiting/living together.
- **Birth registration:** Three in every ten persons (31.8%) had a birth notification document, while one in every ten persons (11.4%) were registered with a birth certificate.

Population characteristics refer to the demographic makeup of individuals within a specific geographic area in terms of factors such as age, sex, marital status, religious affiliation, tribe and nationality and so on. This chapter profiles the composition and characteristics of the Census population.

3.1 Religion

Figure 3.1 reveals that Roman Catholics make up the largest religious denomination, accounting for 16.6 million persons of the total household population and Anglicans/Church of Uganda at 13.3 million persons. Pentecostal/Evangelicals have seen growth rising from 3.8 million persons in 2014 to 6.5 million persons in 2024. Religious affiliation remains a central aspect of Uganda’s population, with 85,559 persons identifying as having no religion (Table 3.1).

Figure 3.1: Distribution of Household Population by Religious Denomination

*Others includes Bahai, Hindus, Buddhists, Ow'obushobozi, Orthodox, among others

3.2 Tribe/Ethnicity

The Constitution of the Republic of Uganda of 1995, as amended in the Third Schedule, provides for Uganda's indigenous communities as at 1st February 1926. Table 3.2 shows the distribution of these communities as well as those not included in the Schedule.

3.3 Marriage

Five in every ten persons (50.6%) aged 18 years and above were married while one in every four persons (26.6%) were cohabiting (Figure 3.2 and Table 3.3).

Figure 3.2 Proportion of Population aged 18 and above by Marital Status

3.4 Birth Registration

Birth registration is the process by which a child's birth is recorded in the Civil Register by the Government authority, National Identification and Registration Authority (NIRA).

Every child has a right to a name and nationality. This is free, accessible to all, and conducted for each newborn child immediately or as soon as possible after birth. Birth registration enables an efficient Government to determine the number of children born in a year and therefore plan the number of schools, health centers and other services required. At the national level, a complete register of births is essential for effective demographic data base and resource planning.

Eleven percent of the total household population were registered with National Identification Registration Authority (NIRA) while 31.8 percent had notifications (Figure 3.3).

Kampala Capital City had the highest (21.5%) percentage of persons that were registered with a Birth certificate while Teso had the lowest (7.5%) (Figure 3.4).

Figure 3.3 Percentage Distribution of Population by Birth Registration

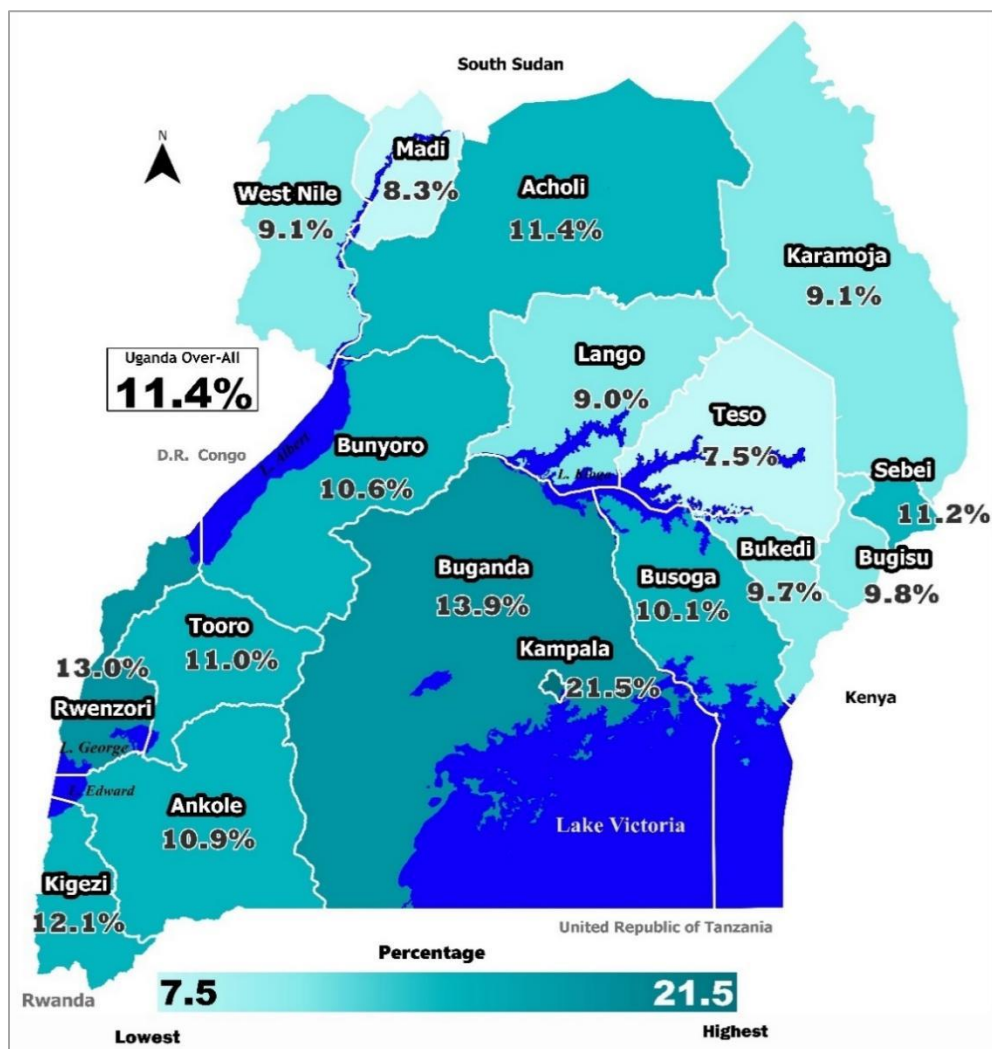

Figure 3.4: Percentage of Population registered with NIRA by sub Region

List of Tables

For more information on population characteristics, see the following tables:

<i>Others</i>	-	10,284
Total Population	34,634,650	45,905,417

1.Others: These are persons who identified themselves as Bagabu, Bakingwe, Benet and Maragoli but are not mentioned in the Constitution.

2.Unclassified: Includes persons enumerated using institutional questionnaire B that did not collect data on tribe. These include the homeless, diplomats, workers in camps, asylum seekers, the sick in hospitals, inmates in prisons/police/immigration/military cells, remand homes, maternity homes, prayer campers, etc.

The individuals who did not state their tribes (404,006 persons) and some in unclassified category largely explains a decline in the population of some tribes.

EDUCATION AND LITERACY

Key Findings

Early Childhood Education attendance:

- Four in every ten (41.6%) children aged 3 to 5 were attending ECE.

Primary school attendance:

- Three in every four children (75.2%) of primary school going age (6-12 years) were attending school.
- 8.9 million learners were in primary school in 2024 regardless of their age.
- 5.8 million learners aged 6-12 years were attending primary school in 2024.

Secondary school attendance:

- Three in every five persons (62.0%) of secondary school going age (13-18 years) were attending school.
- **Highest level of education attained:** Thirty nine percent of the population aged 10 and above attained some primary-level education while 20.2 percent had no formal education.
- **Literacy rate:** Seventy four percent of the population aged 10 and above was literate. Nearly 8 in 10 males (76.6%) and 7 in 10 (71.6%) females were literate.

The Education sector is key in promoting sustainable development through human capacity development of the population in various skills, raising awareness on various issues of national importance and improving general standards of living. The education system aims at training children and adults in a range of skills from basic education to professional development. The country is targeting improving learning outcomes in basic competencies, especially literacy and numeracy for all children. This chapter explores the education status of Uganda's population with a major focus on the formal education system as stipulated in the Education ACT (2008) .

Formal education refers to every category of education where a curriculum recognized by the Ministry of Education and Sports is followed; and a certificate that is recognized by the Ministry is awarded to students upon completing the course being studied. This includes technical and vocational training institutions beyond primary school level, but does not include Bible or Koranic trainings. Other alternative education systems such as FAL (Functional Adult Literacy), ABEK (Alternative Basic Education for Karamoja) and COPE (Complementary Opportunities for Primary Education) were not considered as formal schooling.

The NPHC 2024 focused on measuring the current school attendance and educational attainment of all household members aged 3 years and above. The education level attained was categorized along the respective levels of education as follows: pre-primary education, primary education, secondary education and post-secondary education.

4.1 School Attendance Status

The NPHC 2024 categorized school attendance status into 3 groups: currently attending school (in 2024), attended in the past and never attended.

4.1.1 Early Childhood Education Attendance status

In Uganda, the Ministry of Education and Sports, through the Early Childhood Care and Education (ECCE) Policy recognizes that access to quality ECE is critical for sound intellectual, psychological,

emotional, linguistic, social and physical development and lifelong learning (MoES,2018). Early Childhood Education (ECE) is the most important stage of development in a child's education cycle; since it increases their opportunity to perform better in school and in life. In Uganda, ECE is commonly termed as nursery education or pre-primary schooling for children aged 3 to 5.

Responses were obtained for all persons aged 3 to 5, to establish whether they attended any school during the 2024 school year and the classes they were attending. The children who attended nursery school (baby, middle and top classes) were classified as being in ECE.

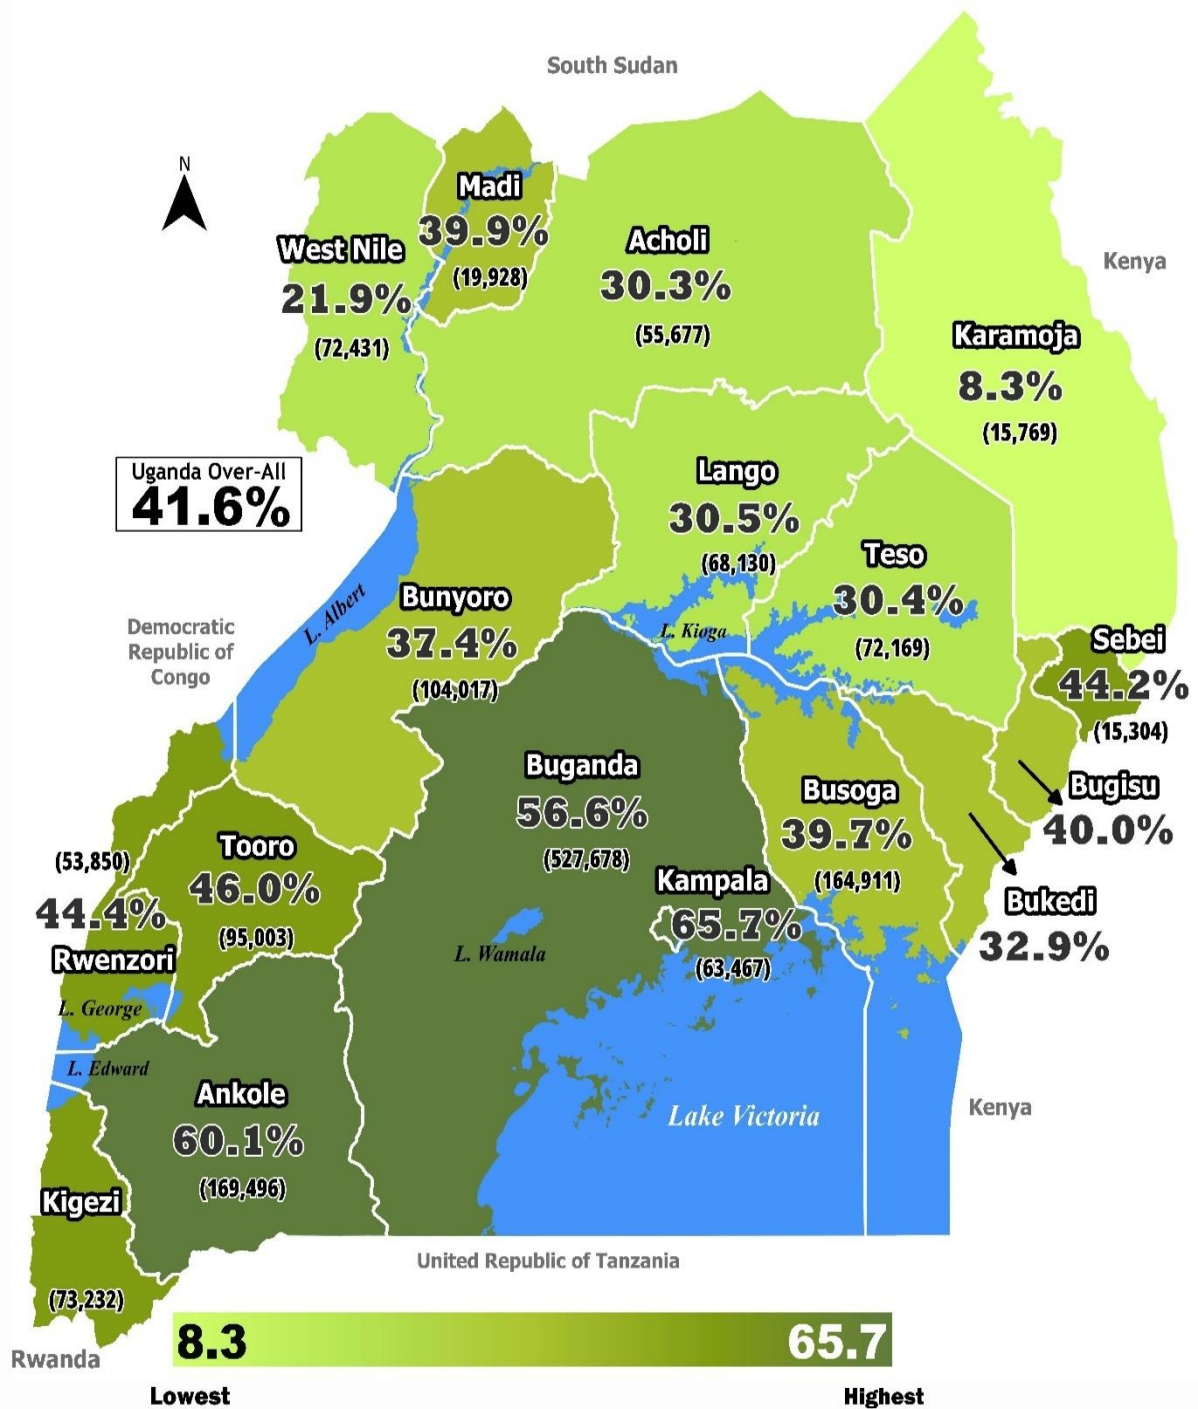

The results presented in Figure 4.1 show that 41.6 percent of the children aged 3 to 5 were attending ECE in 2024. The results further indicate that 42.6 percent of the female children aged 3 to 5 were in ECE, compared to their male counterparts (40.6%). The number of learners in ECE is presented in **Table 4.1**.

Figure 4.1: Proportion of Children attending ECE (3 to 5 Years) by sex, 2024

The analysis of ECE attendance has been presented at sub Regional level in **Figure 4.2**. Kampala Capital City had the highest ECE attendance (65.7%) whereas Karamoja sub Region had the lowest (8.3%).

Figure 4.2: Percentage of the Household Population aged 3 to 5 attending ECE within sub Region

4.1.2 Primary, Secondary and Post-secondary schooling status

Results in Figure 4.3 show that three in every four children of primary school going age were attending school (75.2%).

Three in every five children of secondary school going age were attending school (62.0%).

Figure 4.3: Percentage of Population aged 6-24, by School Attendance Status

4.2 Learners in Primary and Secondary School

School attendance is defined as being in school at any regular recognized educational institution or programme, for organized learning at any level of education.

4.2.1 Primary School Learners

This section presents the school attendance for learners in primary school in the schooling year 2024. All learners who were in primary one to primary seven were considered.

Findings indicate that the total number of learners attending primary school was 8,926,219 learners, with a variation between males (4,495,157) and females (4,431,062) (Figure 4.4, Table 4.2).

The results further show that the number of learners attending primary school at the right age (6-12 years) were 5,828,073 with a variation between males (2,859,113) and females (2,968,960).

By sub Region, Buganda had the highest number of learners attending primary school aged 6-12 (1,495,701) and Sebei sub Region had the lowest learners attending primary aged 6-12 (48,263) **Table 4.3.**

Figure 4.4: Number of Learners in Primary School by Sex

4.2.2 Secondary School Learners

Persons were asked to establish whether they attended any schooling during the 2024 school year and what class they were attending. The persons who attended senior one to senior six were classified as being in secondary school.

Findings indicate that the total number of learners attending secondary school was 4,571,698, with a variation between males (2,035,462) and females (2,536,236) (**Figure 4.5, Table 4.2**).

The results further show that the number of learners attending secondary school at the right age (13-18 years) were 2,190,885 with a variation between males (1,071,197) and females (1,119,688).

Buganda sub Region had the highest number of learners attending secondary school aged 13-18 (673,616) and Sebei sub Region had the lowest number of learners attending secondary school aged 13-18 (22,365) as seen in **Table 4.3**.

Figure 4.5: Number of Learners in Secondary School by Sex

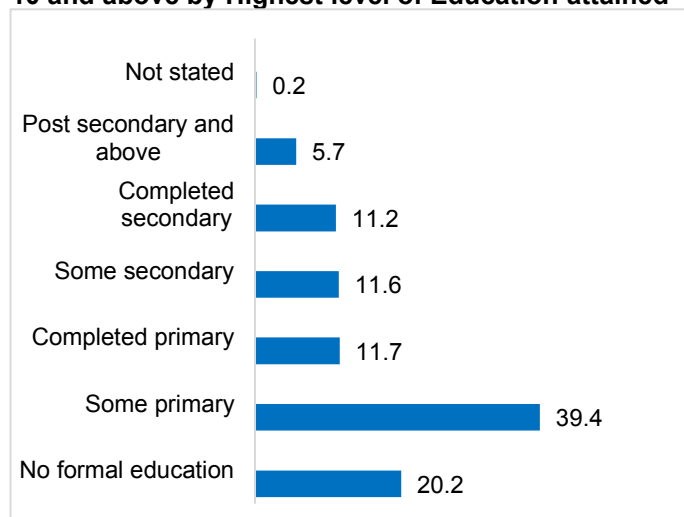

4.3 Education Attainment

Education attainment refers to the highest level of education an individual has completed. It is often used as a measure of a person's academic and professional qualifications. This section presents the distribution of the population 10 years and above by class.

Findings show that about 20.2 percent of the population aged 10 and above had no formal education while 39.4 percent attained some primary-level education. Six percent (5.7%) of the population had attained post-secondary level of education (**Figure 4.6**).

The results also show that 17.4 percent of males and 22.7 percent of females had no education. Five percent (5.2%) of females and six percent (6.4%) of males had completed post-secondary education (**Table 4.4**).

Figure 4.6: Percentage Distribution of Persons Aged 10 and above by Highest level of Education attained

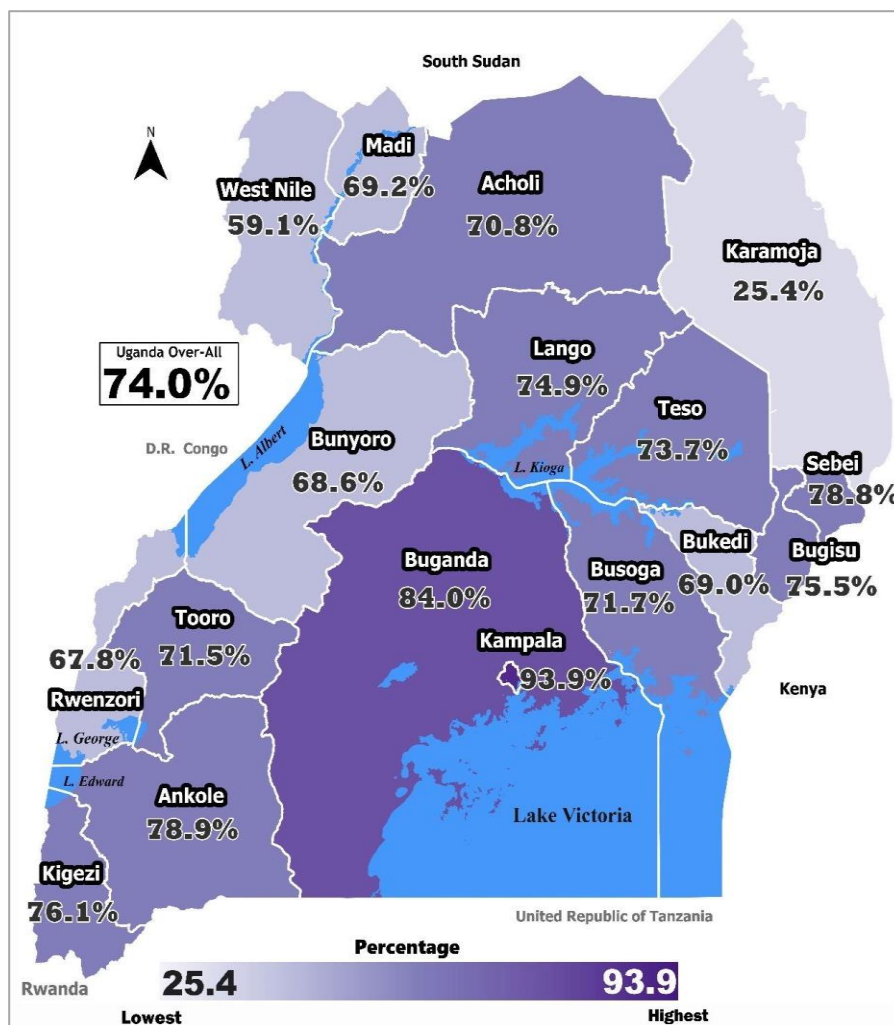

4.4 Literacy

Literacy is defined as the ability to read with understanding and write meaningfully in any language. Literacy is often seen as a basic human right and a critical component of personal and national development.

Overall, the literacy rate was 74.0 percent. Kampala Capital City had the highest literacy rate (93.9%) while the Karamoja sub Region had the lowest literacy rate (25.4%) as shown in **Figure 4.7**. Literacy rate was higher for males (76.6%) than females (71.6%) (**Table 4.5**).

Key Findings

- **Mobile phone ownership:** Four in every ten persons (43.3%) aged 10 and above owned a mobile phone.
- **Ownership of computers and other ICT devices:** Four percent of the households owned a computer, 41 percent owned a radio and 23.1 percent owned a television.
- **Computer use:** Four in every one hundred persons (3.9%) aged 10 and above had used a computer.
- **Internet usage:** Nine percent (8.9%) of persons aged 10 and above had used internet. Of these, 67.0 percent had used the internet for social networking, 15.7 percent for academic work and 12.5 percent for business/office work.
- **Information source:** Thirty eight percent (38.3%) of households used the radio as their main source of information.

Information on ownership and use of ICT as well as number of mobile phones each was collected for people aged 10 and above. The findings in this chapter present data on ICT access and use across different demographics.

By exploring the demographic patterns, we aim to identify barriers that some population groups face in accessing information and to recognize the opportunities that ICT provides for enhanced communication. In addition, it provides a comprehensive overview of the current state of ICT utilization, emphasising its significance in promoting inclusivity and supporting sustainable development. The findings will inform policymakers, educators, and community leaders about the critical role of ICTs in bridging information gaps across diverse populations.

5.1 Mobile Phone Ownership

A mobile phone is a wireless handheld device that allows users to make calls and send text messages, among other features. **Table 5.1** shows that 43.3 percent of the population aged 10 and above owned a mobile phone. The distribution of mobile phone ownership by residence indicates that ownership was higher in urban areas (53.7%) compared to rural areas (37.0%). Forty six percent (46.4%) of males owned mobile phones while 40.7% of females owned phones (**Table 5.1**).

Thirty seven percent had one mobile phone and six percent had at least two phones (**Figure 5.1 and Table 5.2**).

Sub Regional variations revealed that Kampala Capital City had the highest proportion of mobile phone owners at 73.4% while Karamoja sub Region had lowest of 20.1 percent (**Figure 5.2**).

Figure 5.1 Percentage of Population aged 10 and above by Number of Mobile phones owned

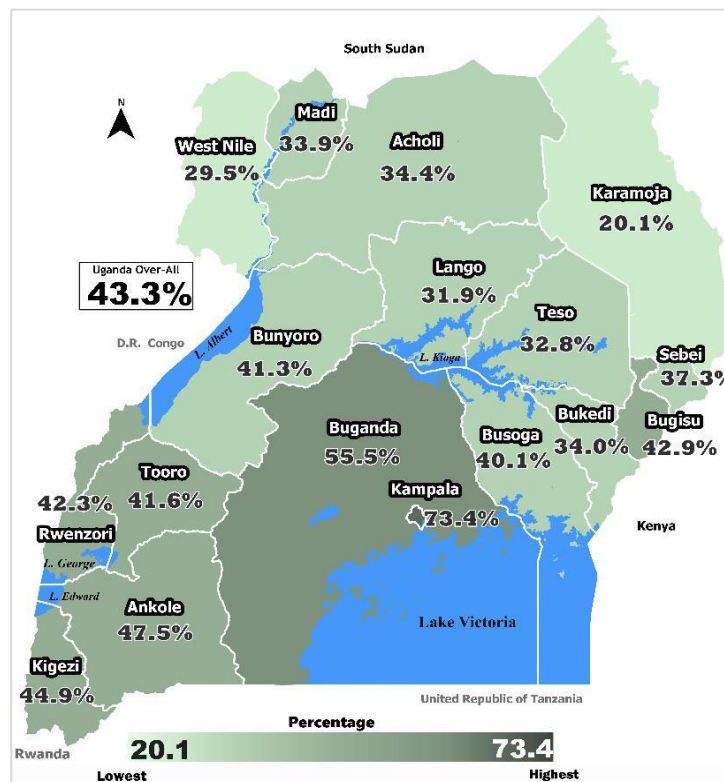

Figure 5.2 Percentage Distribution of Mobile phone Ownership by sub Region

At household level, 76.0 percent of households had at least one member who owned a mobile phone (**Figure 5.3**).

Sub Regional differentials show that Karamoja had the lowest proportion of households (43.2%) with a member owning a mobile phone while Kampala Capital City reported the highest proportion at 92.9 percent.

Mobile phone ownership increased with the educational level of the household head, rising from 51.7 percent among those with no education to 96.0 percent among those with post-secondary education and above (Table 5.3).

Figure 5.3 Percentage of Households that own Mobile phones by sub Region

5.2 Ownership of Computers, Radios and Televisions

Computers and other ICT devices play a pivotal role in enhancing communication, productivity, and access to information. The National Population and Housing Census (NPHC) 2024 collected data on various ICT devices owned by households, including mobile phones, fixed phones, radios, televisions, and computers.

Results in **Figure 5.4** show that 41 percent of the households owned a radio, 23.1 percent owned a television and four percent owned computers. Sub Regional variations (**Table 5.3**) show that Kampala Capital City had the highest proportion (16.1%) of computer owners, while Bukedi, Bunyoro, Tooro and Karamoja had the least (less than 2% each).

Figure 5.4: Percentage of Households that own ICT Devices

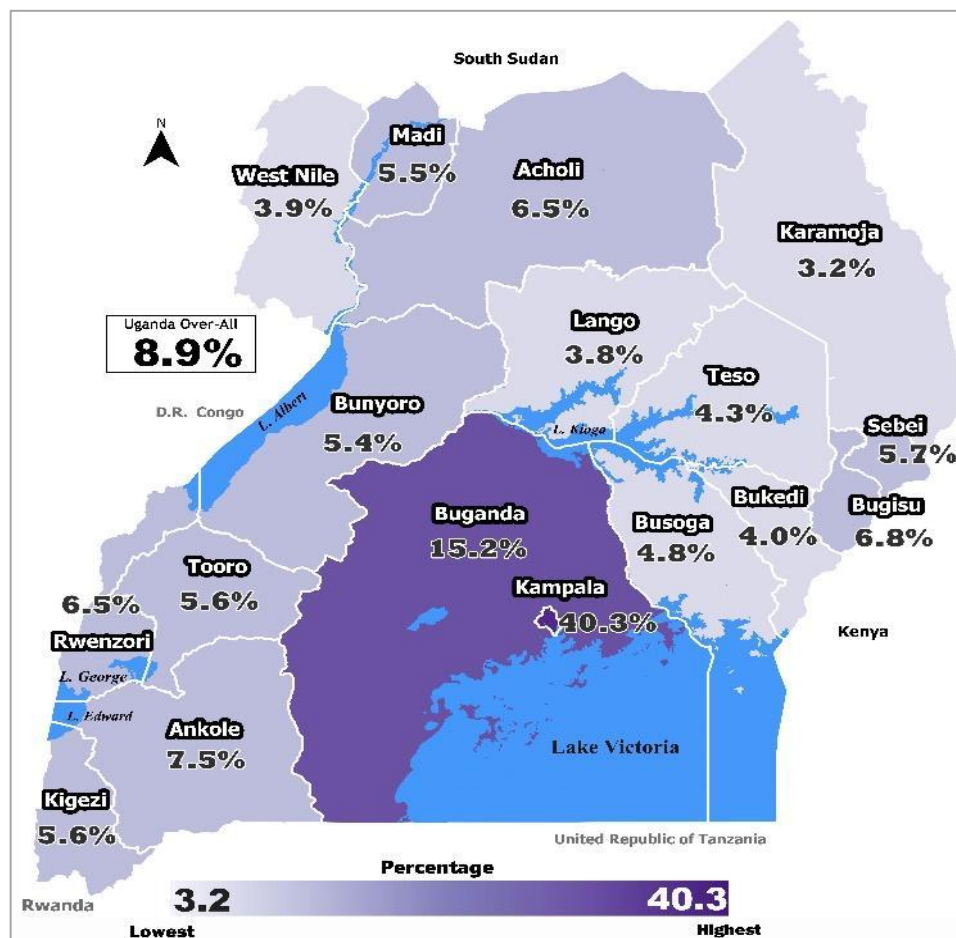

5.3 Internet Use

Internet is a global network of interconnected computer systems that utilize the Internet Protocol Suite to connect devices worldwide. It enables devices to communicate with one another through dedicated routers and servers. Users can access a wide range of information—including text, graphics, voice, video, and software—via mobile phones (Uganda ICT Policy 2013).

Figure 5.5 shows that 8.9 percent of individuals aged 10 and above used the internet. There are notable disparities by sub Region; Kampala Capital City had the highest proportion (40.3%) of internet users, while Karamoja had the lowest proportion (3.2%).

Table 5.5 shows that internet use was higher in urban areas (16.6%) compared to rural areas (4.3%). More males (10.6%) used the internet compared to females (7.6%). Internet use was highest (13.8%) among the youth (18-30 years) and least (2.1%) among children (10-17 years).

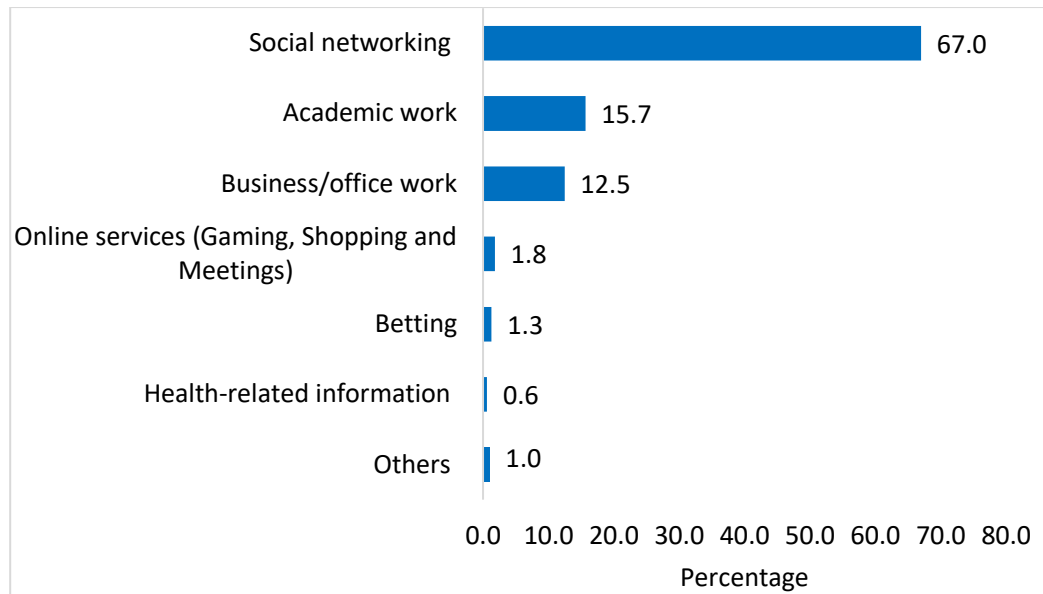

Figure 5.5 Percentage of Internet Users among persons aged 10 and above by sub Region

Purpose of Internet Use

Figure 5.6 shows that among individuals who used the internet, 67 percent used the internet for social networking, while less than one percent (0.6%) used the internet for health-related information. Sixteen percent of individuals used the internet for academic work, and 12.5 percent for business/office work. **Table 5.6** provides details on purpose of internet use by sex, residence, education level attained, sub Region and age group.

Figure 5.6 Percentage Distribution of Population aged 10 and above by Purpose of Internet Use

5.4 Information Source

Sources of information refer to the various channels through which households obtain knowledge and updates about their environment and community.

The main source of information considered is based on the household members' usage, rather than ownership of the medium. This means that if a household primarily relies on a particular source of information, it is included, even if no member owns that medium. Common sources of information include traditional media such as radio and television, word of mouth, phone calls, social media, internet searches, email, community meetings and local announcers.

Figure 5.7 shows that overall, 38.3 percent of households reported radio as their main source of information. Twenty two percent reported word of mouth, 14.9 percent reported phone calls, and 14.1 percent reported television as their main source of information. **Table 5.7** presents the main sources of information for households by selected background characteristics.

Figure 5.7 Percentage of Households by Main source of Information

List of Tables

For more information on information and communication technology, see the following tables:

SELECTED HEALTH CHARACTERISTICS

Key Findings

- **Ownership of a mosquito net:** Eighty-seven percent (87.2%) of households owned at least one mosquito net.
- **Health insurance coverage:** One percent (1.1%) of the population had health insurance coverage.
- **Probable General Psychological Distress:** One in every ten (12%) of the population aged 10 and above had experienced at least some form of probable general psychological distress.

The Uganda Vision 2040 emphasises that good health is instrumental in facilitating socio-economic transformation. The Government has put in place measures for ensuring improvement in the health conditions of the population. This has led to progress in a number of health indicators. The production of statistics on health in the country has continued to help measure the impact of the interventions put in place. This chapter presents information on household ownership of mosquito nets, health outbreak awareness as well as access to health insurance.

6.1 Ownership of Mosquito Nets

Household ownership of mosquito nets is one of the central interventions for preventing malaria infection in Uganda. Each household in the NPHC 2024 was asked if they owned mosquito nets.

Eighty-seven percent (87.2%) of the households owned at least one mosquito net. A higher share of households in rural areas (88.2%) owned a mosquito net compared to their urban counterparts (85.8%) (Figure 6.1 and Table 6.1).

Table 6.2 shows that 85.4 percent of the mosquito nets were obtained from Government, 14.1 percent were bought, and 3.1 percent were obtained from NGOs.

Figure 6.1: Percentage of Households owning Mosquito Nets by Place of Residence and Sex of Household head

Mosquito net Ownership by Source

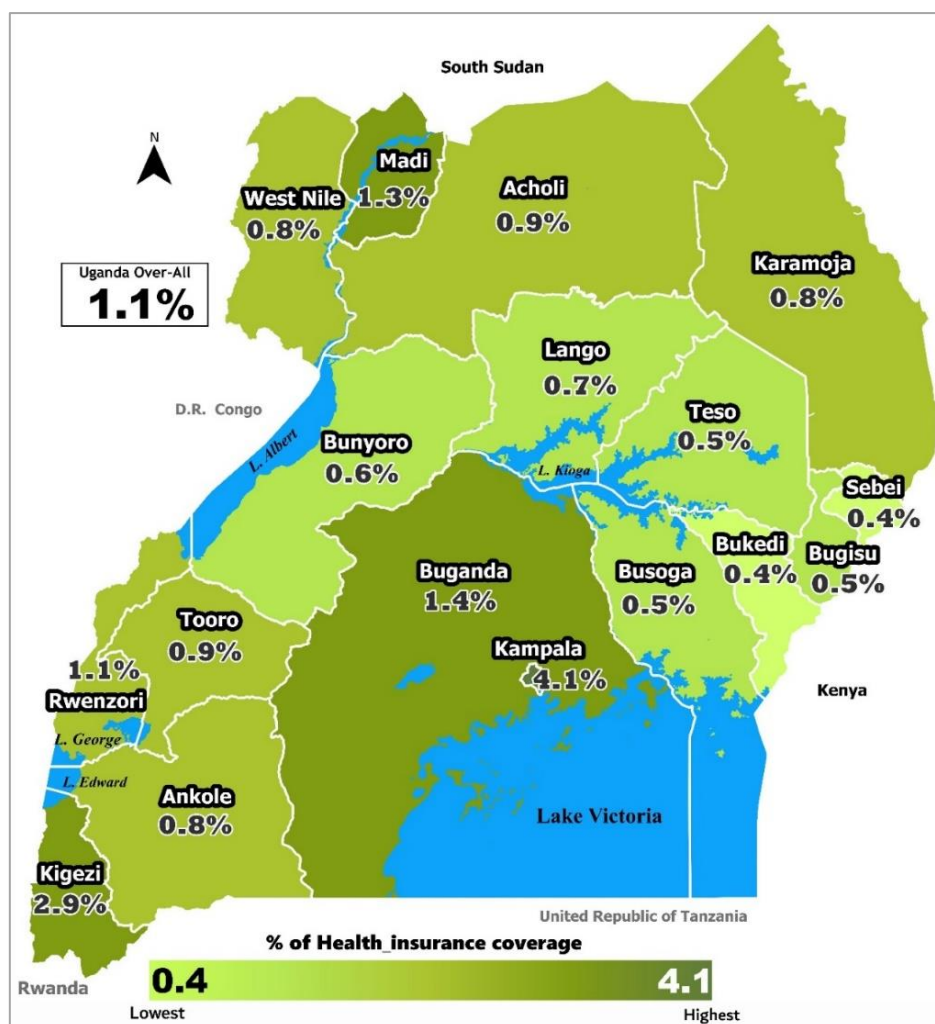

There were sub Regional variations in household ownership of mosquito nets; Teso sub Region had the highest proportion of households with at least one mosquito net (93.8%) while Kampala Capital City had the least proportion (78.8%) (Table 6.1). The percentage of households from urban areas (23.0%) who bought mosquito nets was nearly three times that of rural areas (8.2%). Government was the main source of mosquito nets (85.4%) For details (Table 6.2)

6.2 Health Insurance

A health insurance policy is an agreement between the insured and the insurance company whereby the insurance company agrees to cover the costs of certain medical benefits such as medical tests, availing drugs to sick clients and offering treatment services. In the process, the insurance company contracts some service providers like hospitals, clinics, pharmacies; etc from where the insured persons can access medical services.

The NPHC 2024 collected information on whether household members were covered by any health insurance policy or medical scheme. The results in Table 6.3 show that Uganda's health insurance coverage is low, at one percent (1.1%) of the household population. There were no sex disparities between males and females in health insurance coverage. The health insurance coverage in urban (1.6%) was more than two times that of rural areas (0.7%). Regional variations show that Kampala Capital City had the highest (4.1%) health insurance coverage, while Bukedi and Sebei sub Regions and the lowest (0.4% each).

Figure 6.2: Percentage of the Population with Health Insurance coverage by sub Region

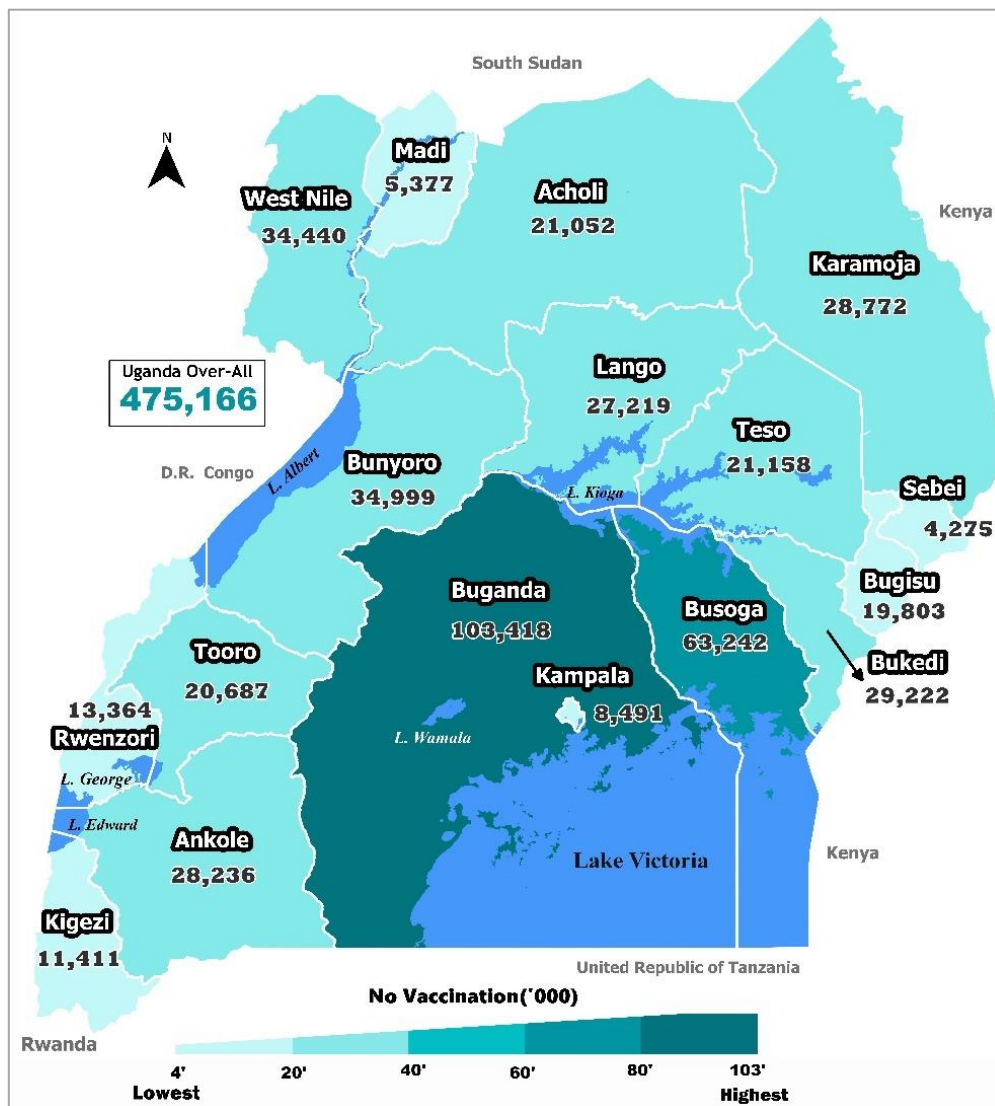

6.3 Vaccination Coverage

Vaccination helps protect children against infectious diseases that can cause illness or death. It protects children against common vaccine-preventable diseases and is crucial in reducing childhood morbidity and mortality. The NPHC 2024 collected information on routine basic childhood vaccination, including Bacillus Calmette Guérin (BCG) (tuberculosis), Oral Polio Vaccine (OPV) and Inactivated Polio Vaccine (IPV), pentavalent or DPT-HepB-Hib (diphtheria, pertussis, tetanus, hepatitis B, and Haemophilus influenza type B), pneumococcal conjugate vaccine 10 (PCV10), Rotavirus Vaccine (RV), and Measles Rubella (MR) vaccine. Respondents were also asked whether the children had vaccination cards or an exercise book.

The information presented in this chapter is for children aged 0-2, the age at which they should have received at least one of the basic vaccines. Vaccination coverage was 86.9% of children aged 0-2. However, 475,166 children (12.2%) had not received any vaccine. Buganda sub Region had the highest number of children who had not received any vaccine (103,418), while Sebei sub Region had the least (4,275) (Figure 6.3 and Table 6.4).

Figure 6.3: Number of Children aged 0-2 who had not received any Vaccine by sub Region

6.4 Health Outbreaks

A health outbreak is a sudden occurrence of a disease or health condition in a specific geographic area population or community that exceeds the expected number of cases. An outbreak may affect a small group of people within a community or thousands of people across the entire community and beyond. In some instances, an outbreak may not be easily or quickly identified until it has affected so many people causing immense effects like death on the populace at large.

The NPHC 2024 collected information on perceptions of events that signify a health outbreak. This provides insights into community awareness of unusual events that may be early signals of an outbreak. Census findings show that there was limited awareness in the community on potential health outbreaks in Uganda. Figure 6.4 shows that one in three (33%) respondents were aware that if severe symptoms such as vomiting, diarrhea, or abdominal pain occurred to three or more people from separate households in a 24 hour period, it would signal a health outbreak. 35.7 percent of the respondents reported that if five or more people in the same household or nearby households had a fever, it would signal a health outbreak. Table 6.5 provides details by sex, residence and sub Regions.

Figure 6.4: Percentage of Respondent's Perception on Events that signal a Potential Health Outbreak

6.5 Mental Health Disorders

Mental health is a state of well-being that allows individuals to cope with life's challenges, realize their potential, learn and work well, and contribute to their community. This includes emotional, psychological and social aspects of an individual's life. Mental health is a human rights issue. It is more than the absence of a mental disorder, exists in complex continuum and is experienced differently from one person to another.

The information collected on mental health experiences of individuals included anxiety, sadness, suicidal tendencies, hearing voices that others don't hear and extreme mood swings. The information was used to measure probable mental health disorders (probable general psychological distress) in an individual.

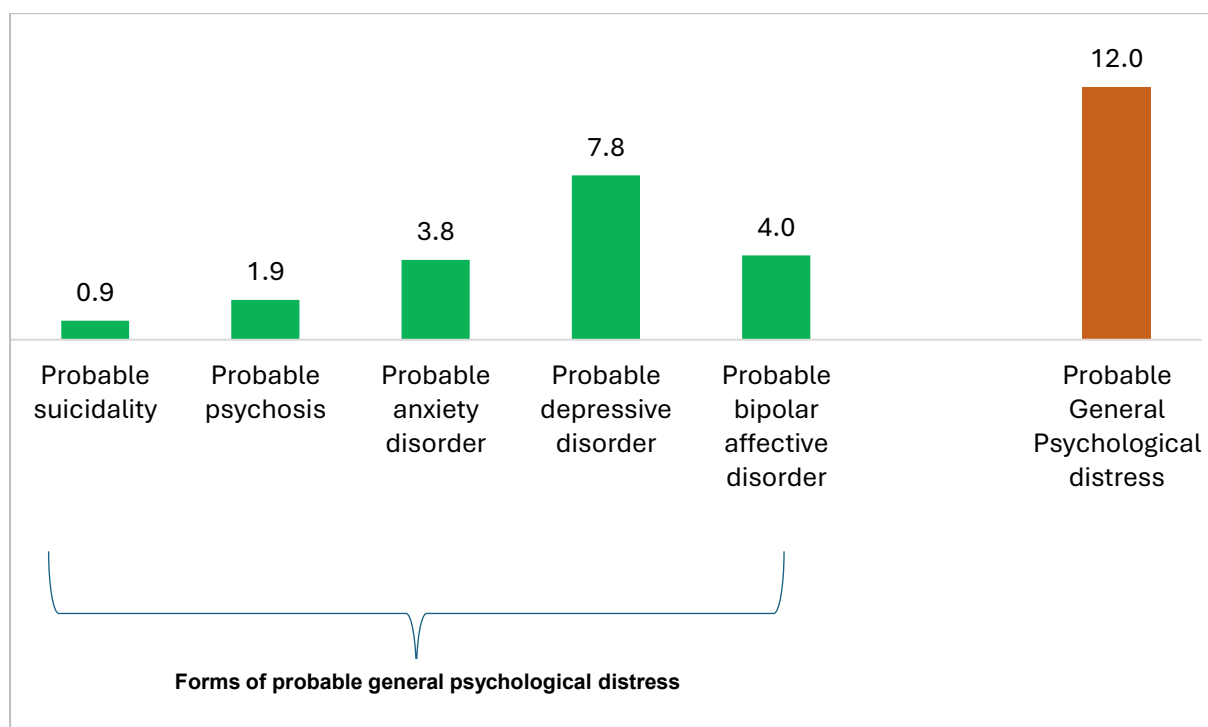

Mental health disorder (general psychological distress) is a psychiatric condition characterized by disturbances in cognition, emotion, or behavior, leading to distress or disability in important areas of life such as socializing, work, or self-care.

- **Probable anxiety disorder:** The likelihood of someone being anxious i.e., normally feels worried, nervous or anxious.
- **Probable depressive disorder:** Losing interest in pleasurable activities and having low feelings, sadness and stress
- **Probable psychosis:** Seeing things that others don't see or hearing voices that others don't hear
- **Probable bipolar affective disorder:** Having extreme emotions and mood swings
- **Probable Suicidality:** The experience of suicidal plans, thoughts or attempts

Eligibility: Population aged 10 years and above.

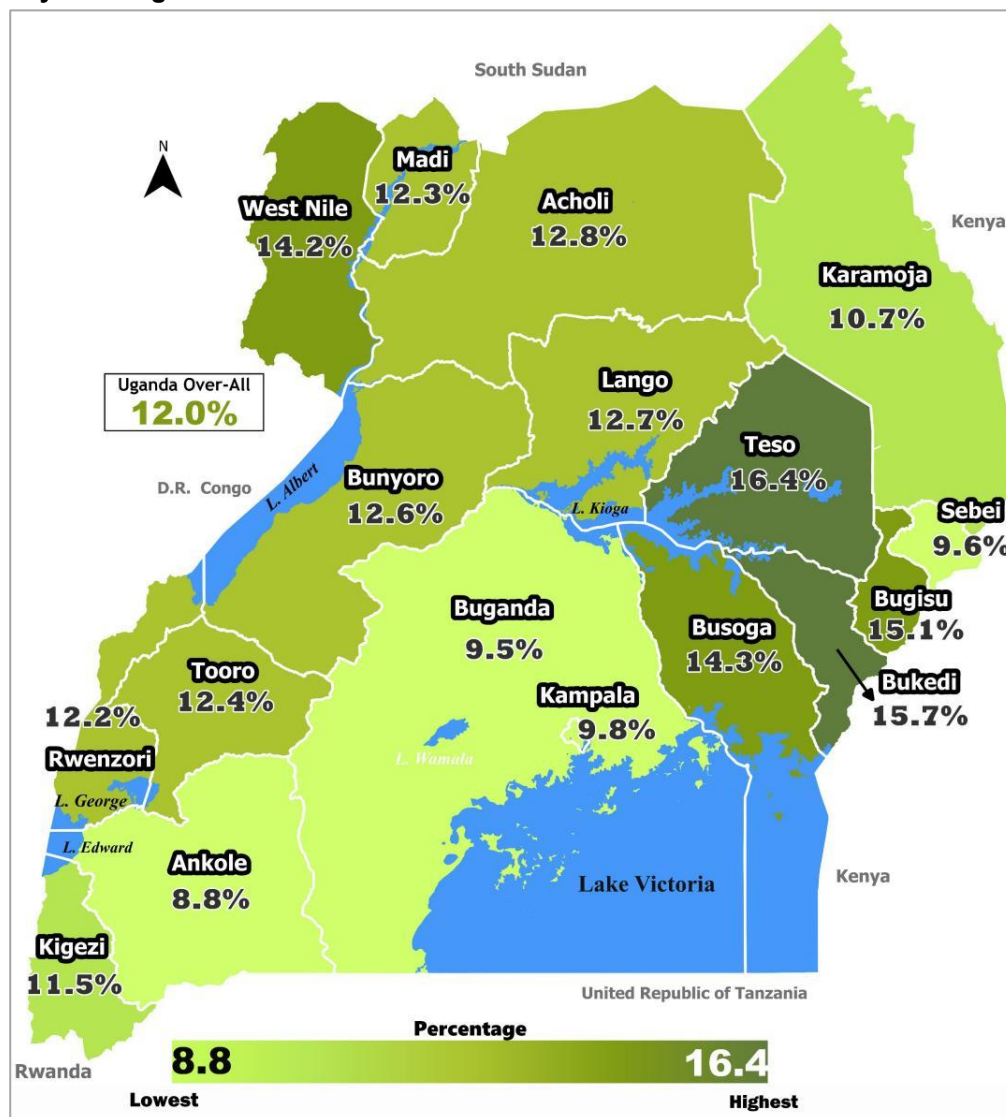

Figure 6.5 shows that 12 percent of the population aged 10 and above had experienced at least some form of probable general psychological distress. Probable depressive disorder (7.8%) was the most prevalent condition, while probable suicidality was the least (0.9%).

Figure 6.5: Percentage of Persons aged 10 and above with Probable General Psychological Distress

Probable general psychological distress was most prevalent in Teso sub Region (16.4%), and least in Ankole (8.8%) (Figure 6.6 and Table 6.6)

Figure 6.6: Percentage of Persons aged 10 and above with Probable General Psychological Distress by sub Region

Key Findings

- **Crude Birth Rate:** The crude birth rate was 33.2 births per 1,000 population.
- **Total Fertility Rate:** The total fertility rate was 4.5 children per woman, a decline from 5.8 children in 2014.
- **Adolescent Childbearing:** Of the adolescent girls aged 10-19, seven percent had begun childbearing, five percent had a live birth, and two percent were pregnant with their first child.

Fertility is one of the three components of population dynamics, the others are mortality and migration. For countries lacking timely and reliable system of vital statistics, fertility data provides an opportunity for estimating vital rates that would otherwise not be available.

Fertility levels determine the age structure of a population which, in turn, governs the social, economic and demographic characteristics of the population. There are several indicators used to measure current fertility. Recent and lifetime fertility are the main indicators used to estimate fertility rates from Census data. The reliability and robustness of fertility estimates from census data are thus dependent on the quality of the reporting of these indicators.

The 2024 Census asked questions about the number of children ever born to women aged 10 – 59 years. However, for measurement of fertility in this census, women aged 15-49 were considered. In order to reduce the error of omission of children not living with their mothers, the children were categorized by Sex and into total children ever born, children alive and children dead. In addition, for every woman who had ever had a birth, information was sought on the date of the last birth, the Sex of last child and its survival status.

Whereas the Uganda Demographic and Health Survey used direct questions asked to the girl or woman herself, during the Census such information was obtained using proxy response except for those women who were household heads. The Census does not include questions on birth history of the children born. The data collected included children ever born, date of last child born alive, age of mother at first birth, marital status, age of mother and pregnancy status to improve fertility estimates based on children ever born. This data is, therefore, more likely to be affected by some errors due to recall lapse. Moreover, there is a tendency for women to under report their births, including misunderstanding of the reference period, under-reporting of still births and deliberate under-reporting of births which all lead to the under-estimation of fertility.

7.1 Current Fertility

Fertility analysis is important in understanding past, current and future trends of population size, structure and growth. Information on fertility levels, patterns and trends experienced by a country is important for socio-economic planning, monitoring and evaluating programmes.

To formulate or evaluate policies concerning population growth, information is needed not only about the number of births but also on trends of birth rates and other measures of fertility over time.

7.2 Measures of Current Fertility

Current fertility can be measured using the Crude Birth Rate (CBR), General Fertility Rate (GFR), Age-Specific Fertility Rate (ASFR) and the Total Fertility Rate (TFR). Current fertility was estimated using the Brass P/F Ratio indirect estimation method, which uses data on the number of births and children born to woman alive in the year preceding the Census date.

7.2.1 Crude Birth Rate

The Crude Birth Rate (CBR) is defined as the number of births that occur in a particular year per 1,000 population. There were 1.5 million children born in the twelve months prior to the Census date. The population of Uganda was 45.9million. This gives a CBR of 33.2 births per 1,000 population. The CBR for Uganda declined from 50.4 births per 1,000 population in 1969 to 33.2 births per 1,000 population in 2024 (**Figure 7.1**).

Figure: 7.1: Crude Birth Rate (Births per 1,000 Population) by Census years, 1969-2024

7.2.2 Age Specific Fertility Rate

The Age-Specific Fertility Rate (ASFR) is the number of births per 1,000 women in a specific age group in a given year. It provides the age pattern of fertility. Childbearing starts early with women aged 15-19 years old. It also peaks early at 20-29 years and then declines thereafter. A sharp decline in ASFRs is witnessed between 35-39 and 40-44 age groups (**Figure 7.2**). See Table 7.2 for details. The ASFR has remained the same, it starts and peaks early. The fertility levels have declined but remained relatively high.

Figure: 7.2: Age Specific Fertility Rate (ASFR) by Census Years (2014-2024)

7.2.3 Total Fertility Rate (TFR)

Total Fertility Rate is the average number of children who would be born to a woman by the end of her reproductive life if she survives to the end of her reproductive lifespan (15-49) and experiences the given Age Specific Fertility Rates (ASFRs). The Total Fertility Rate (TFR) in Uganda is 4.5 children per woman, implying that a woman in Uganda is expected to give birth to an average of about five children (4.5 children per woman) by the end of her reproductive period.

The Total Fertility Rate (TFR) was 4.5 births per woman showing a drop from 7 children in the 1969 Census. The TFR stagnated at 7 births per woman from 1969 to 2002 then declined to 5.8 births per woman in 2014. (Figure 7.3)

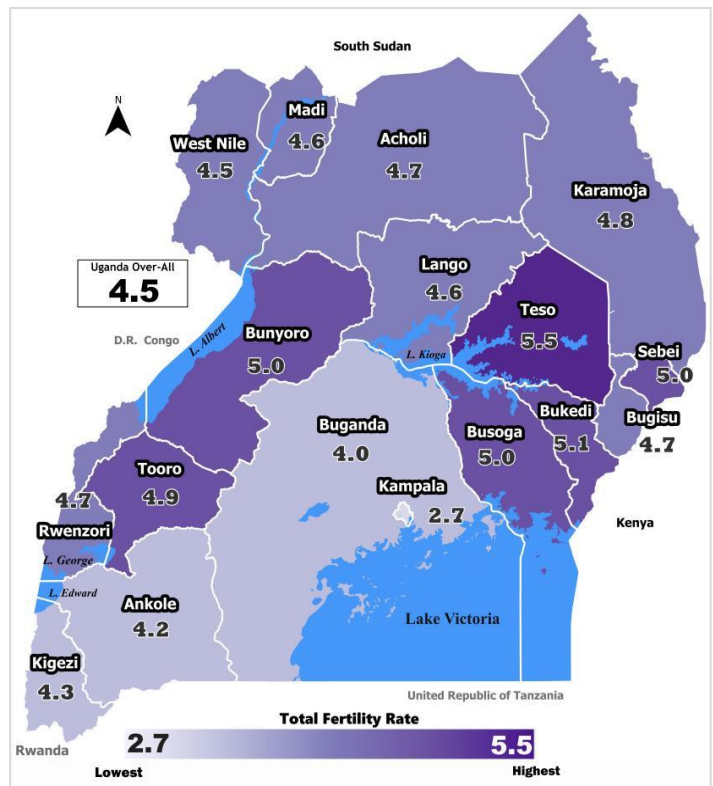

Figure 7.3: Total Fertility Rates (TFR), 1969-2024

7.3 Regional Fertility Differentials

Teso sub Region had the highest total fertility rate of 5.5 while Kampala Capital City had the lowest at 2.7 (Figure 7.4).

Figure 7.4: Total Fertility Rates by Sub Regions

7.4 Adolescent Childbearing

Teenage pregnancy and motherhood refers to adolescent girls aged 10-19 who had given birth or were pregnant with their first child at the time of the Census. It remains one of the health and social concerns among Youth and adolescents in Uganda. Teenage pregnancy and motherhood is associated with high morbidity and mortality for both the mother and the child.

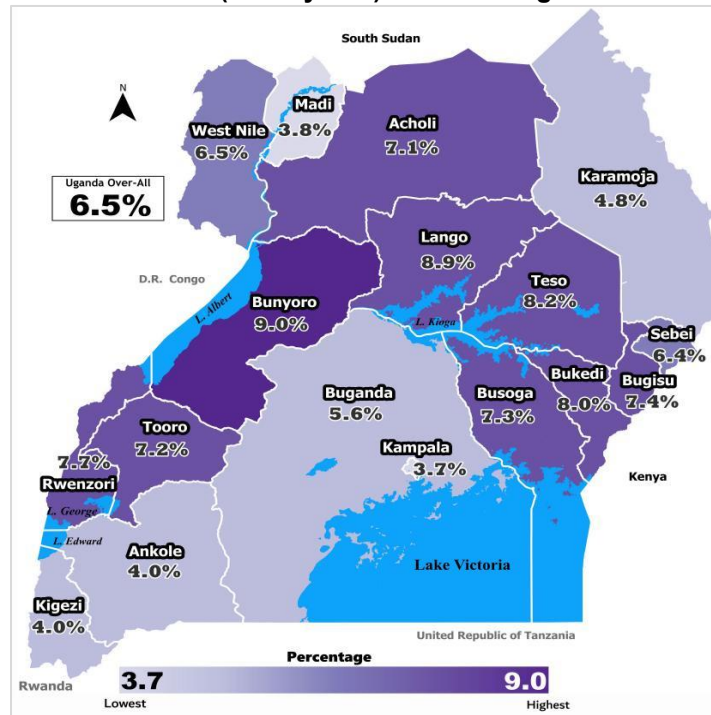

Figure 7.5: Percentage of Adolescent girls who had a live birth, were pregnant with their first child or had begun childbearing

Adolescent girls are vulnerable to pregnancy and likely to face health problems during delivery because their bodies may not be physically ready compared to older women. The Census 2024 figures do not compare with UDHS given that the respondent during the census may not have been the girl herself (proxy respondent used). Seven percent (6.5%) of adolescent girls, aged 10-19 had begun childbearing, five percent had a live birth and two percent were pregnant with their first child (Figure 7.5).

Bunyoro Sub Region had the highest percentage (9%) of adolescent girls aged 10-19 who had begun child bearing, while Kampala Capital City had the lowest (3.7%). (Figure 7.6)

Figure 7.6: Percentage of Adolescents (10-19 years) who had begun Child Bearing by sub Region

7.5 Adolescent Birth rate

SDG Indicator 3.7.2 measures adolescent birth rate per 1,000 women aged 10–14 and 15–19.

The adolescent birth rate represents the level of childbearing among females in the particular age group. Birth reporting was based on a proxy respondent in cases where the female was unavailable. Figure 7.7 indicates that 29 women out of every 1,000 aged 10-19 years gave birth 12 months before the census. The rate for the age group of 15-19 years was 61 births per 1,000 women.

Disaggregation by Sub Region reveals that the highest (40 births per 1,000 women aged 10-19 years each) adolescent birth rate was recorded in Bunyoro and Lango Sub Regions. The lowest birth rate was recorded in Kampala Capital City at 15 births per 1,000 women aged 10-19 years (**Table 7.4**)

Figure 7.7: Adolescent Birth Rate per 1,000 Women

Key Findings

- **Infant mortality:** For every 1,000 children born alive, 34 die before they mark their 1st birthday.
- **Under-5 mortality:** The Under-5 mortality rate was 46 deaths per 1,000 live births.
- **Life expectancy at birth:** Average Life Expectancy at birth in 2024 was 68.2 years, with 70.1 years for females and 66.9 years for males.
- **Maternal Mortality Ratio:** The maternal mortality ratio was 207 deaths per 100,000 live births.

Mortality refers to deaths that occur within a population. Infant and childhood mortality is highly sensitive to the socio-economic changes in the country. Therefore, studying levels of mortality provides an indirect measure of the welfare of a given population.

The 2024 National Population and Housing Census (NPHC) collected information that was used to compute mortality levels and these included deaths in the households, survival of parents, children ever born and children surviving.

8.0 Estimation Procedure

To estimate child mortality, data on Children Ever Born (CEB) and children Dead (CD) was used to generate proportions dead by age of mother. These were then converted into probabilities of dying by age. For adult mortality, data collected from recent deaths in the household (deaths that occurred in the household, twelve months prior to the Census) was used. The reported deaths were adjusted based on the level of completeness using the Brass Growth Balance method. The Brass Growth Balance method is a technique used to assess the completeness of death reporting in relation to population data. The analysis involved the linkage of child and adult mortality to construct the life tables. The completeness of death reporting was estimated at 53 percent for females and 83 percent for males using the Brass growth balance method.

8.1 Crude Death Rates

The Crude Death Rate (CDR) is the number of deaths per 1,000 population in a given year. There were 212,393 deaths that occurred during the 12 months preceding the Census night, resulting in a Crude Death Rate (CDR) of 5 deaths per 1,000 persons.

8.2 Childhood Mortality

Infant Mortality Rate (IMR) is the probability that a newly born child will not survive to the first birthday (less than 1 year).

Under 5 Mortality Rate is the probability that a child born will not survive to the fifth birthday (less than 5 years).

Sustainable Development Goal (SDG) 3 focuses on healthy lives and well-being for all at all ages, including reducing childhood mortality. By 2030, target 3.2 of the goal is to end preventable deaths of new-borns and children under five years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 deaths per 1,000 live births and under-five mortality to as low as 25 deaths per 1,000 live births.

8.2.1 Infant Mortality Rate

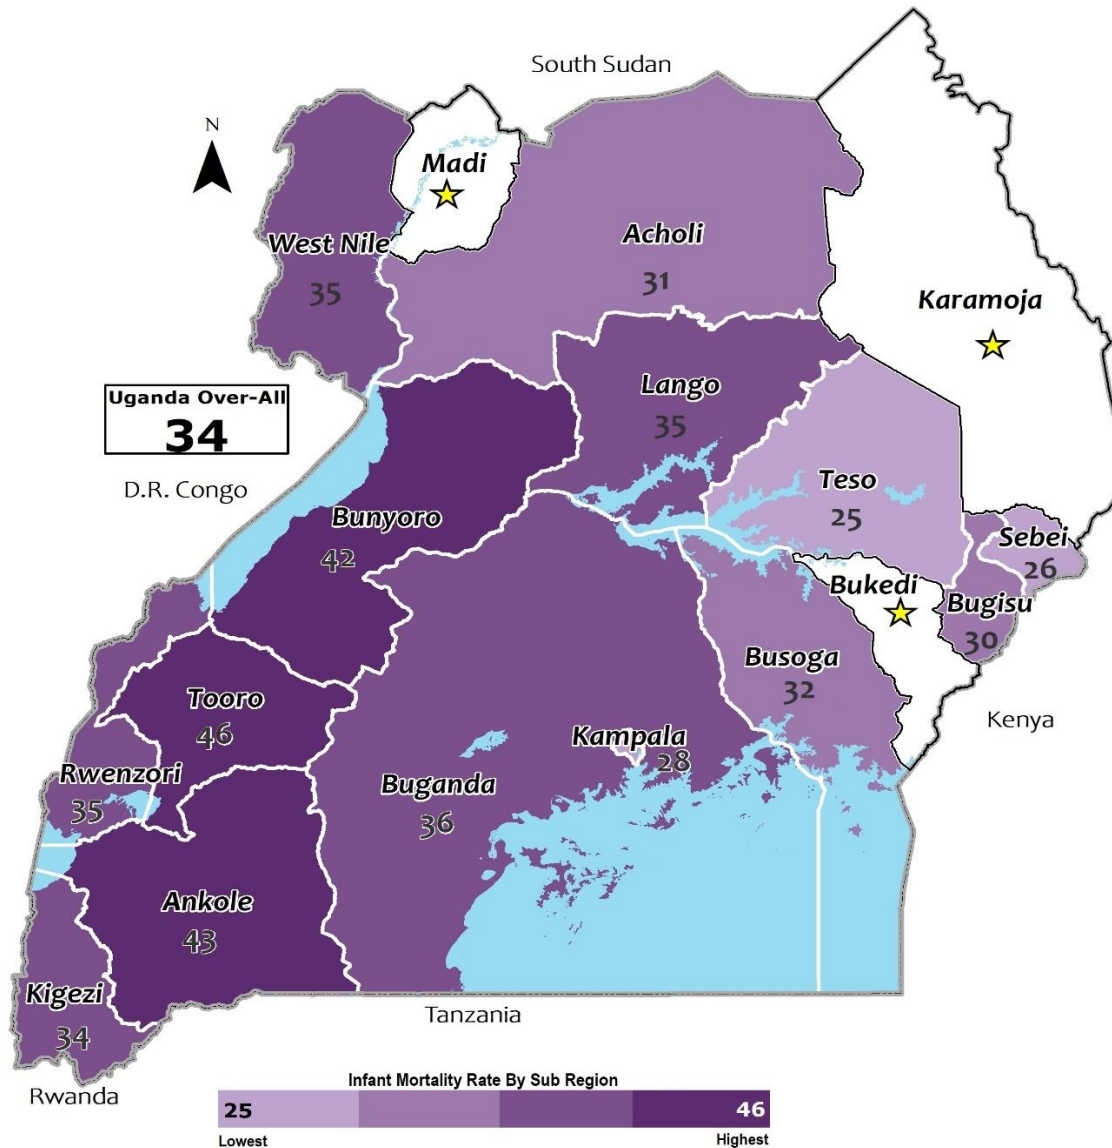

Infant Mortality Rate (IMR) is the probability of dying of children below age one expressed per 1,000 live births in a given year. The indirect estimation of IMR is based on Brass P/F Ratio method using data on children ever-born and children surviving at the time of the Census. The probability of dying before the first birthday (IMR) in 2024 was 34 deaths per 1,000 live births (**Figure 8.1**). The IMR among males (37 deaths per 1,000 live births) was higher compared to that of females (30 deaths per 1,000 live births). **Figure 8.1** also shows a decline in IMR from 118 deaths per 1,000 births in 1969 to 34 deaths per 1,000 births in 2024.

Figure 8.1: Infant Mortality Rate (deaths per 1,000 live births) 1969-2024

At sub Regional level (**Figure 8.2**), the infant mortality rate was highest in Tooro at 46 deaths per 1,000 live births and lowest in Teso at 25 deaths per 1,000 live births.

Figure 8.2: Infant Mortality Rates (deaths per 1,000 live births) by sub Region

Note: In the map above, ★ represents the sub Regions whose Infant Mortality Rates have been excluded pending further investigations. See Technical Note in the Appendix for more details.

8.2.2 Under 5 Mortality Rate

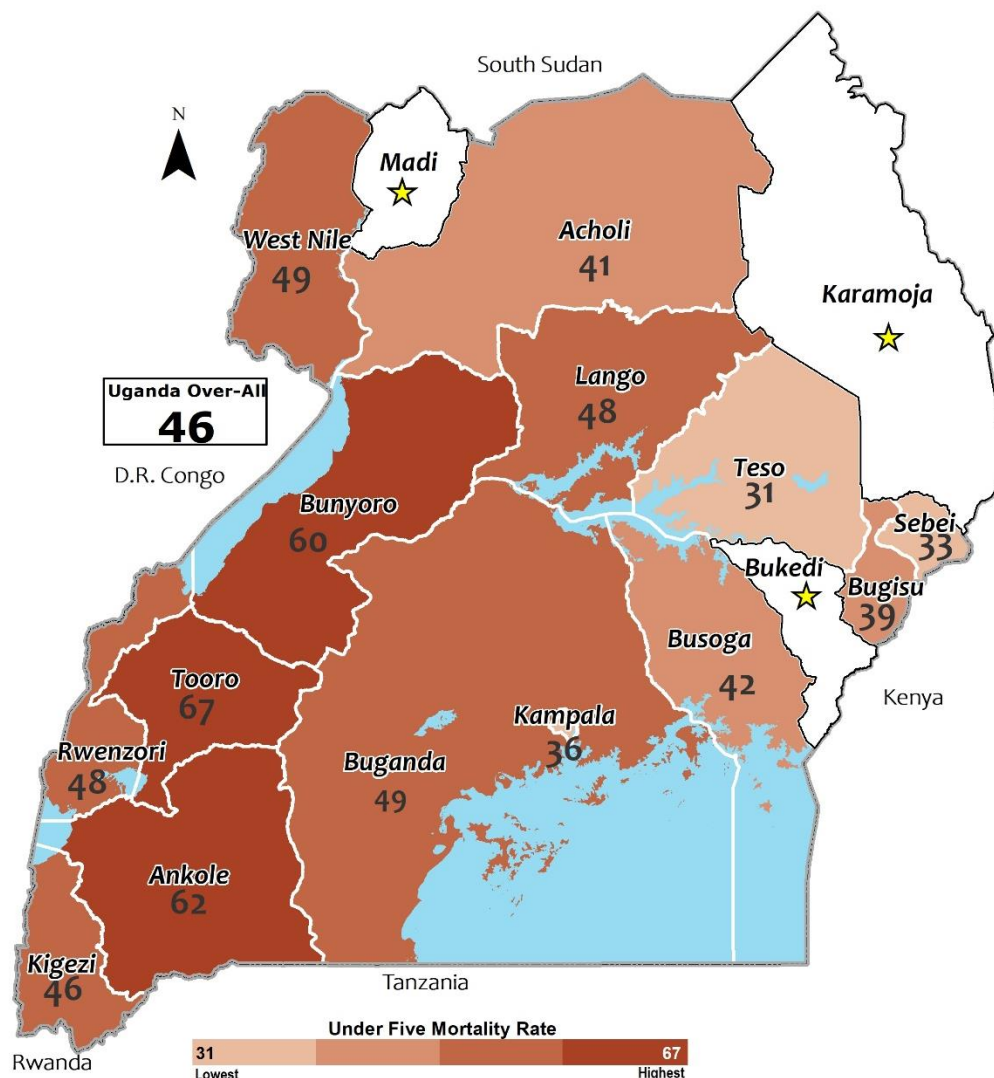

Under five Mortality Rate (U-5 MR) is the probability of dying of children between birth and exact age five, expressed per 1000 live births in a given year. Overall, the Under five mortality rate was 46 deaths per 1,000 live births (**Figure 8.3 and Table 8.2**). There has been a decline in U5-MR from 198 deaths per 1,000 births in 1969 to 46 deaths per 1,000 births in 2024. There is a Sex differential in U5-MR with males having a higher rate compared to females (50 vs 41 deaths per 1,000 live births).

Figure 8.3: Under 5 Mortality Rate (deaths per 1,000 live births), 1969-2024

At sub Regional level, the Under five mortality rate was highest in Tooro sub Region (67 deaths per 1,000 births) and lowest in Teso (31 deaths per 1,000 births) as shown in **Figure 8.4**. Further analysis is to be undertaken to establish the drivers for low levels of mortality in Karamoja and Madi and high mortality in Tooro.

Figure 8.4: Under 5 Mortality Rates (deaths per 1,000 live births) by sub Region

Note: In the map above, ★ represents the sub Regions whose Under 5 Mortality Rates have been excluded pending further investigations. See Technical Note in the Appendix for more details.

8.3 Maternal Mortality

Information on maternal mortality was collected from women aged 10-59 years. However, the analysis focuses on women in the reproductive age group (15-49 years). Questions on mortality referred to deaths that had occurred in the household within the last 12 months and whether the deceased was pregnant at the time of death, died during childbirth or within six weeks after childbirth.

The Maternal Mortality Ratio (MMR) refers to maternal deaths per 100,000 live births excluding those that occurred due to “accident” and “violence”. In total, 41,222 women aged 15–49 years died 12 months before the Census night. Tables 8.6 and 8.7 show PRMR of 233 deaths per 100,000 live births and MMR of 207 deaths per 100,000 live births.

The Life Time Risk (LTR) of maternal death reflects the chances of a woman dying from maternal causes over the course of her 35-year reproductive lifespan. This indicator takes into account the probability of a death occurring due to maternal causes each time a woman becomes pregnant. The overall life time risk of maternal death was therefore calculated by multiplying the maternal mortality rate by 35. The overall LTR for PRMR was about 11.5 and that of MMR was about 10.2.

8.4 Place of Death

Understanding the patterns of mortality and place of death, the location or setting is important to help provide appropriate services and resources for primary health care especially end-of-life care. When the death occurs in the health facility, it is easier to manage and administer the deceased’s medical certification for cause of death than when it occurs outside the health facility. The country has made some progress in the registration of deaths, where the Ministry of Health in collaboration with National Identification and Registration Authority (NIRA) and other key stakeholders have spearheaded registration of health facility and community deaths. The goal of this analysis is to measure the percentage of deaths that occur in the health facilities to guide the programming for certification for cause of death.

The NPHC 2024 collected information on registration and place of occurrence, for those households that reported a death in the 12 months prior to the census. Figure 8.5 shows that overall, 48.7 percent of deaths occurred in the health facility. Spatial differentials by sub Region shows that Madi Sub Region had the highest (58.3%) percent distribution of deaths that occurred in the health facility, while Karamoja Sub Region had the lowest (36.7%).

Figure 8.5: Percentage Distribution of Deaths by Place of Occurrence

8.5 Life Expectancy at Birth

Life expectancy at birth is the average number of years that a newborn could expect to live, if he or she were to pass through life exposed to the sex- and age-specific death rates prevailing at the time of his or her birth, for a specific year, in a given country, territory, or geographic area.

Life Expectancy at birth is a measure often used to gauge the overall quality of life of a nation. It gives a summary measure of the mortality experience of the population at all ages. A life table consists of data on survivorship and the probability of dying of individuals within a given population. An increase in life expectancy at birth could be attributed to improvements in healthcare, among other things.

Figure 8.6 shows that the overall life expectancy at birth in 2024 was 68.2 years. The life expectancy at birth for males (66.9 years) was lower compared to their female counterparts (70.1 years). This means that males and females born in Uganda now and subjected to the current levels of mortality at the different ages are expected to live for 66.9 years (males) and 70.1 years (females).

Figure 8.6: Life Expectancy at Birth (1969-2024)

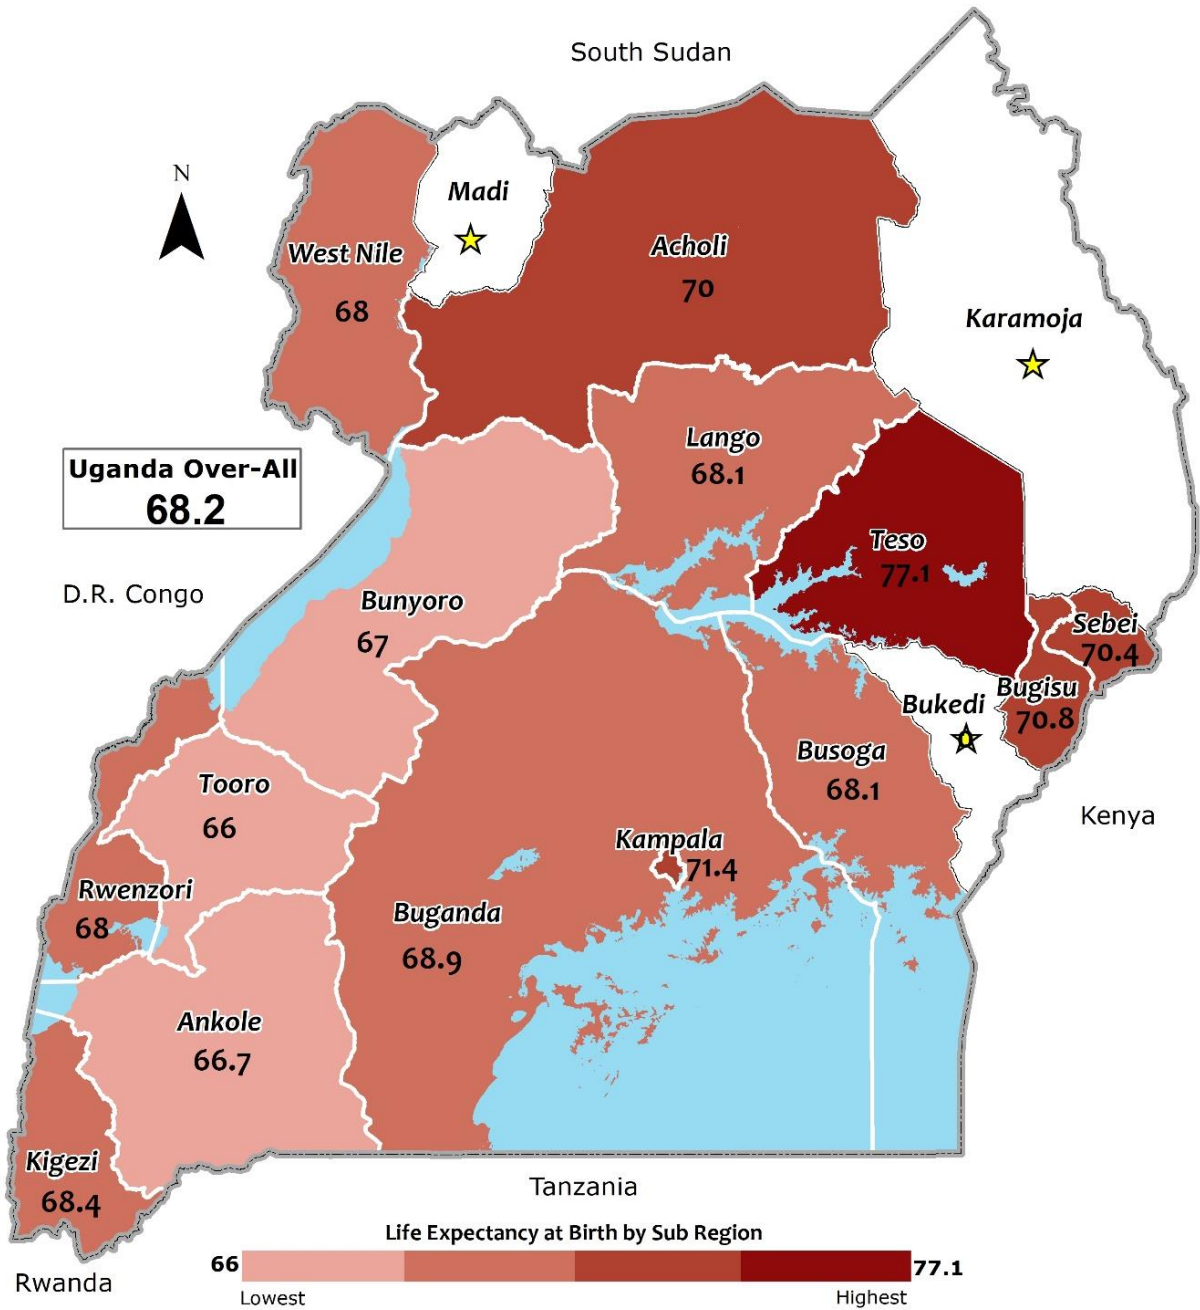

Figure 8.7 shows life expectancy at birth by sub Region. Teso sub Region had the highest life expectancy at birth of 77.1 years while Tooro sub Region had the lowest at 66.0 years.

Figure 8.7: Life Expectancy at Birth by sub Region

Note: In the map above, ★ represents the sub Regions whose Life Expectancy at birth figures have been excluded pending further investigations. See Technical Note in the Appendix for more details.

List Of Tables

For more information on mortality, see the following tables:

- Table 8.1 Household Population and Deaths in the last 12 months by Age group
- Table 8.2 Childhood Mortality Rate by sub Region
- Table 8.3 Abridged Lifetable for Males
- Table 8.4 Abridged Lifetable for Females
- Table 8.5 Overall Abridged Lifetable
- Table 8.6 Pregnancy Related Maternal Mortality Rate
- Table 8.7 Maternal Mortality Ratio
- Table 8.8 Percent Distribution of Deaths in the last 12 months by Place of Occurrence and sub Region
- Table 8.9 Place of Death registration by sub Region

Table 8.1: Household Population and Deaths in the last 12 months by Age group

Age group	Household population			Reported Deaths in last 12 months			Adjusted deaths*		
	Male	Female	Total	Male	Female	Total	Male	Female	Total

Key Findings

- **Internal migrants:** More persons moved out of Kigezi sub Region (-19.6%) and Kampala Capital City (-13.9%) than those who came in. More people moved into Bunyoro (10.4%) and Buganda (9.8%) sub Regions than those who moved out.
- **Immigrants:** There were 1,022,577 immigrants, with almost half (45.2%) coming from South Sudan.
- **Emigrants:** Fifty one percent of the total emigrants left for Asia as their place of first destination. Eighty three percent of emigrants moved for job-related reasons.

Migration statistics refer to the general indicators on the size, composition, and characteristics of a migrant population. Migration is the movement of persons from one place to another, either wilfully or being forcefully displaced due to various reasons that may be natural or human conflicts (IOM, 2019). Forced displacement results into refugees, asylum seekers and internally displaced persons. Migration is one of the components of population change which has social and economic implications to a country.

9.1 Internal Migration

Internal migration is the movement of people involving change in residence within national borders. Persons whose sub Region of current residence was different from the sub Region of previous place of residence but within the country were regarded as internal migrants.

9.1.1 In and Out migration

This section presents internal migration between sub Regions measured by in and out migration. Out-migrants are those persons who had moved out of the sub Region (i.e. a previous residence) and were enumerated elsewhere while in-migrants are those persons who moved into the sub Region of enumeration.

Findings show that Kampala Capital City (56.9%), Buganda (22.5%), Bunyoro (21.2%) and Tooro (20.4%) had higher in-migration rates compared to other sub Regions (**Figure 9.1A**).

Kampala Capital City (70.8%), Kigezi (26.3%), Ankole (15.6%) and Bukedi (17.2%) had higher out-migration rates compared to other sub Regions (**Figure 9.1B**).

Table 9.1 shows the number of in-migrants and out-migrants by sub Region.

The difference between the in-migration and out-migration is the Net migration. Findings show that the more persons move out of the sub Regions of Kigezi (-19.6%), Kampala Capital City (-13.9%) than those who came in. (**Figure 9.1C & Table 9.1**).

Similarly, more people moved into the sub Regions of Bunyoro (10.4%) than those who moved out. (**Figure 9.1C & Table 9.1**).

Figure 9.1A: In-Migration Rate by sub Region

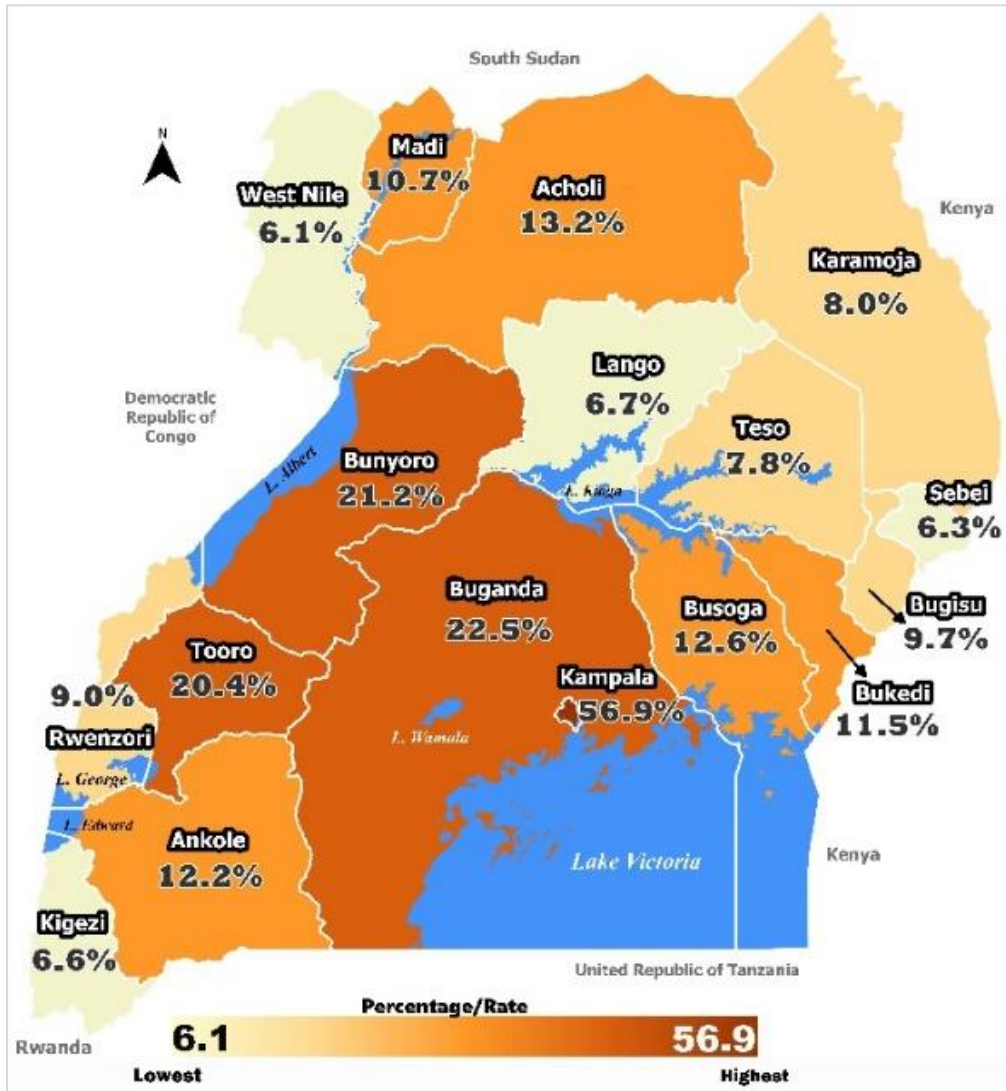

Figure 9.1B: Out-Migration Rate by sub Region

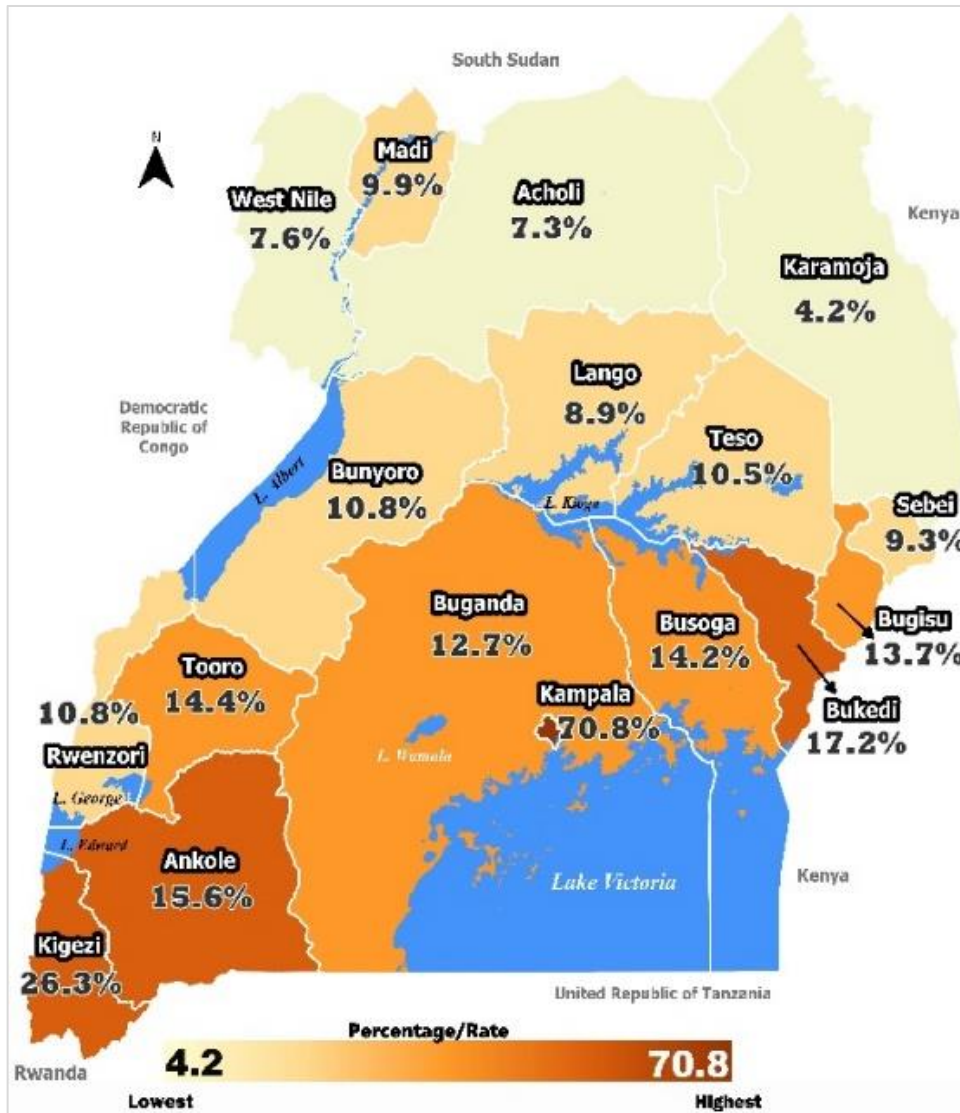

Figure 9.1C: Net Migration by sub Region graph

9.1.2 Reasons for Internal Migration

Findings show that the most common reason for internal migration was family-related (45.8%) and the least was climate-related (0.7%) (Figure 9.2).

Figure 9.2: Reasons for Internal Migration (%)

*Climate related include droughts, floods, landslide/mudslides, irregular rainfall.
 **Family related reasons include marriage, stay with relative.

9.2 Immigration

This section presents immigration statistics measured by number of Non Ugandans who resided in Uganda on the census night and had stayed for at least six months. The Census focused on country of birth and previous residence.

9.2.1 Immigrants

Results from the census show that there was a total of 1,022,577 immigrants at the time of enumeration.

Figure 9.3 shows that the highest percentage (45.2%) of immigrants were from South Sudan. Immigrants from Europe, America, other Africa and Oceania collectively constituted one percent.

Figure 9.3 Percentage Distribution of Immigrants, by Place of Origin

9.2.2 Reasons for Immigration

Among the immigrants at the time of the Census 2024, 45.5 percent mainly migrated for security-related reasons, 28.4 percent for family-related reasons and eight percent (7.9%) for employment-related reasons. Less than one percent (0.3%) migrated for climate-related reasons. (**Figure 9.4 and Table 9.2**).

Figure 9.4 Percentage Distribution of Immigrants by Main Reason for Moving into Uganda

*Climate related include droughts, floods, landslide/mudslides, irregular rainfall.

**Family related reasons include marriage, stay with relative.

9.3 Emigration

Emigration is the relocation or process of people leaving one country to reside in another. People leave Uganda mainly for reasons related to employment and improving quality of life.

9.3.1 Emigration by Destination

Findings show that Asia was the destination for more than half (50.9%) of the emigrants. East Africa was the destination for 26.8 percent of emigrants (**Figure 9.5**).

Figure 9.5: Percentage Distribution of Emigrants by Destination

9.3.2 Main Reasons for Emigration

Table 9.3 shows the distribution of emigrants based on their current residence and reason for outmigration. The main reason for emigration was employment-related (82.5%).

9.4 Refugee/ Asylum seeker Characteristics

A refugee is a person who, having qualified to be granted refugee status under section 4 of the Refugees Act, 2006 CAP 201 Laws of Uganda 2024, has been granted refugee status by the Eligibility Committee under section 20 (2) of the Act, or is a member of a class of persons declared to be refugees under section 25 of the Act.

An asylum seeker is a person who has made an application for the grant of refugee status under section 19 of this Act but has not yet been granted refugee status.

9.4.1 Refugees/ asylum seekers distribution by sub Region

There were a total of 805,589 refugees/ asylum seekers during the time of census, accounting for two percent of the population. West Nile sub Region had the highest number of refugees/ asylum seekers (185,793 persons). Sebei sub Region had the lowest number of refugees/ asylum seekers (142 persons) (**Table 9.4**).

9.4.2 Registration status of refugees/ asylum seekers

More female refugees/ asylum seekers were registered (336,437 females) compared to their male counterparts (334,616 males) (**Figure 9.6 and Table 9.4**).

Figure 9.6: Refugee Registration Status by Sex (Number)

Key Findings

	International standard	National context
Working Age Population (WAP)	25,494,490 (57.4%)	25,155,922 (56.7%)
Employment to Population Ratio (EPR)	37.9%	37.5%
Unemployment Rate	1,358,549 (12.3%)	1,355,589 (12.6%)
Labour Force Participation Rate (LFPR)	43.2%	42.9%
Youth Not in Employment, Education or Training (NEET)	4,001,528 (42.6%)	5,250,768 (50.9%)

Labour force characteristics of the household population, offer an essential context for interpreting labour market indicators. Labour statistics are critical for measuring a nation's economic growth and development.

They play a vital role in monitoring and evaluating national and international development frameworks, such as the National Development Plan (NDP) III, Africa Agenda 2063, and the 2030 Agenda for Sustainable Development Goals (SDGs), all aimed at improving the welfare and quality of life for Ugandans. To address the urgent need for poverty reduction and enhance welfare, the Government of Uganda has prioritized investment and job creation, as reflected in the theme of the National Development Plan (NDP) III: "Sustainable Industrialization for Inclusive Growth, Employment, and Sustainable Wealth Creation."

The labour force is a key driver of any economy, representing the segment of the population that is actively engaged in or seeking employment. Labour force characteristics provide insights into productivity, development potential, and structural challenges within the economy. This chapter presents essential labour market indicators, including the labour force participation rate, employment-to-population ratio, unemployment rate, potential labour force, and employment status, aligning with the definitions established by the 19th and 20th International Conference for Labour Statisticians (ICLS) of the International Labour Organization (ILO).

To allow for international and national comparison of indicators, the following age groups have been used;

- 15+ years; International definition of Working age group international
- 14-64 years; Uganda's definition of Working age group
- 15-24 years; International definition of Youth
- 18-30 years; Uganda's definition of Youth

10.1 Working Age Population (WAP)

The International Labour Organisation recognises population aged 15 and above (ILO 2024: Modelled Estimate) as the Working Age Group.

The National Employment Policy 2011 for Uganda defines the Working Age Population as the population aged 14-64 years.

The findings show that 25,494,490 persons (57.4%) were in the working age group 15 years and above. The number of females (14,181,219) in the working age group was higher than that of males (11,313,271) (**Table 10.1A**). Considering age group 14-64; 25,155,922 persons (56.7%) were in the working age group with more females (13,872,948) than males (11,282,974) (**Table 10.1B**).

Regional variations show that Kampala Capital City had the highest percentage (69.8%) of their population in the working age group 15+ while Karamoja sub Region had the least percentage (49.6%) of working age population. (**Figure 10.1A**). Table 10.1A provides details for population age 15 and above.

Figure 10.1A: Percentage of the Working Age Population (15+) to the Household Population by sub Region

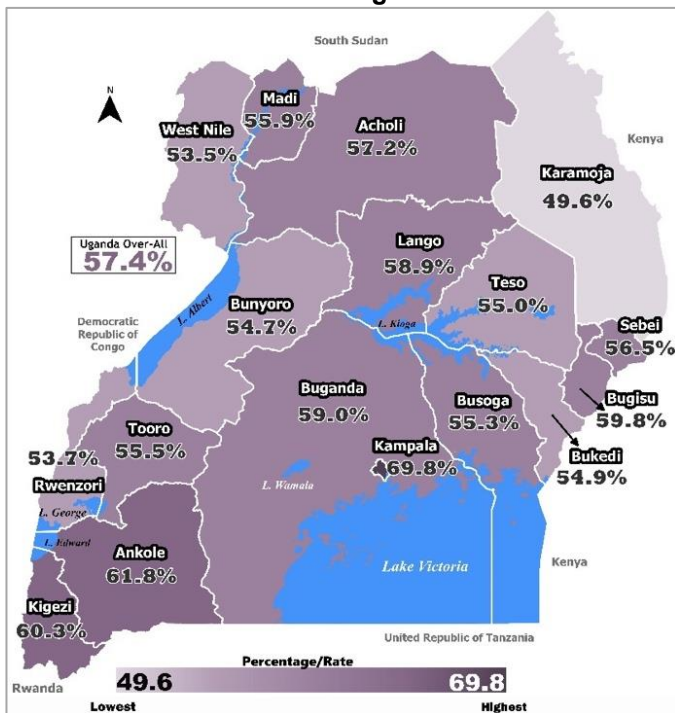

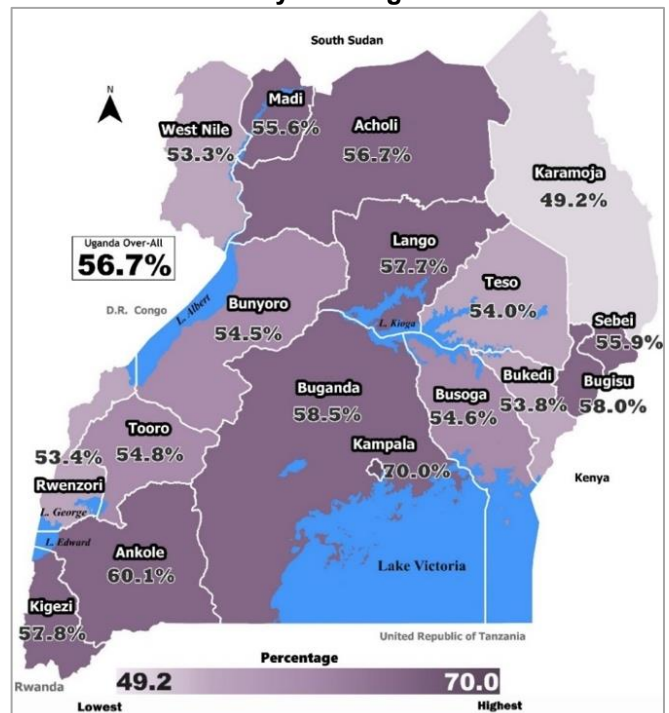

Figure 10.1B: Percentage of the Working Age Population (14-64) to the Household Population by sub Region

10.2 Employment to Population Ratio

The Employment-to-Population Ratio (EPR) refers to the proportion of the Working Age Population that is in employment (working for pay or profit for the benefit of others). This is the total number of employed persons expressed as a proportion of the working age population. The EPR, also known as the Employment Rate, provides a good indication of the degree to which the economy is utilizing its key productive labour resource.

The Employment-to-Population Ratio (EPR) in 2024 was 37.9 percent indicating that about 4 in 10 persons aged 15 and above were employed (**Figure 10.2A**). The EPR was higher (43.8%) among males than females (33.1%) aged 15 and above. The EPR was higher (42.6%) among urban populations compared to those in rural areas (34.9%). Disaggregation of the employed population by education attainment showed that majority of those who had attained post-secondary and above were employed (65.8%) while those with no formal education had the lowest at 31.3 percent an indication that the probability of being in employment increases with education attainment. (**Table 10.2**).

Among persons aged 14-64, the EPR was 37.5 with a higher share among males (43.0%) than females (33.1%). Sub Regional differentials show that persons aged 14-64 years in Kampala Capital City had the highest EPR (53.5%) while Madi had the lowest (19.7%) (**Figure 10.2B**). Table 10.2 provides details for persons aged 15 and above.

Figure 10.2A: Employment-to-Population Ratio for persons aged 15+ by sub Region

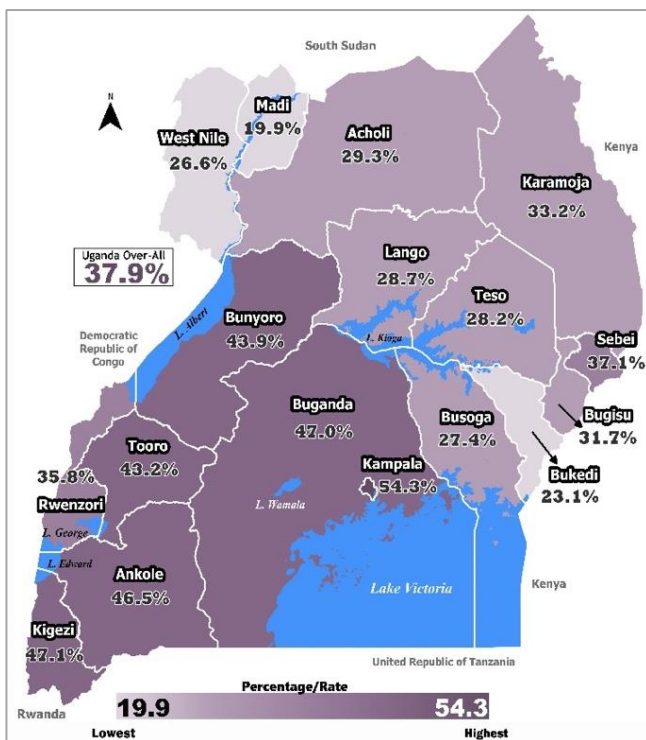

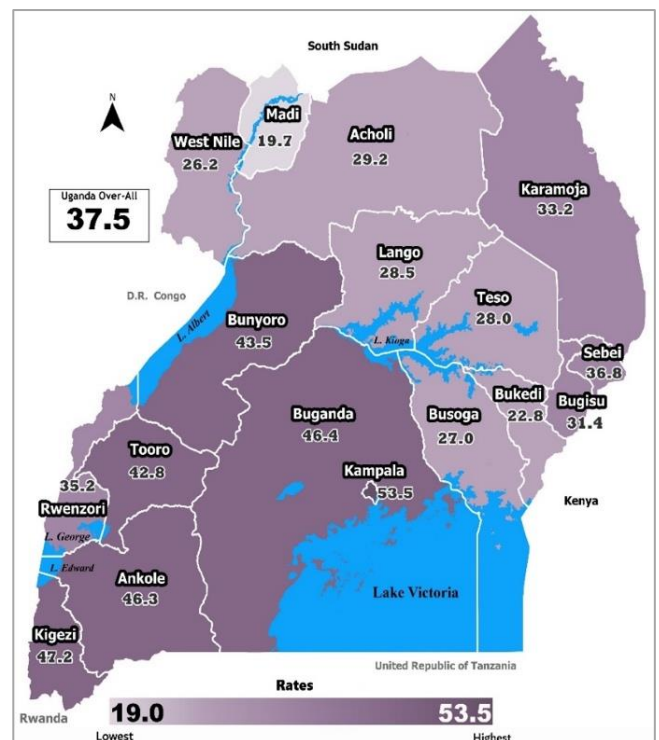

Figure 10.2B: Employment-to-Population Ratio for persons aged 14-64 by sub Region

10.3 Status in Employment

According to ILO, Status in Employment is defined as one’s relationship to his/her employer on the main job. This is classified into five categories namely: Employees, Paid Apprentices, Interns/Trainees, Employers (those who hire employees), Own-account Workers (those who do not hire employees), and Helpers (unpaid individuals involved in a family business). These categories are defined as follows:

- i. **Employees** - This encompasses all types of employees, including permanent, fixed-term, short-term, and casual employees.
- ii. **Paid apprentice, intern, trainee**- A paid apprentice, intern, or trainee generally refers to individuals who are gaining work experience or training in a specific field while receiving compensation.
- iii. **Employer (with hired employees)** - This group comprises individuals who own corporations as well as those operating household market enterprises.
- iv. **Own-account worker (without hired Employees)** - This category includes owner-operators of corporations that do not have employees and own-account workers in household market enterprises without hired help.
- v. **Helper (without pay) in a family business** - These individuals assist in a family business without receiving pay and are recognized as contributing family workers.

The highest percentage (39.0%) of employed population aged 15 and above were employees and the lowest (1.7%) were paid apprentices, trainees or interns (**Figure 10.3**). There were more male employees (44.9%) compared to females (32.8%) (Table 10.3). A similar pattern is observed for persons aged 14-64 as shown in **Figure 10.4** and Table 10.4.

Figure 10.3 Status in Employment among the Working Age Population (15+ years)

Figure 10.4 Status in Employment among the Working Age Population (14-64 years)

10.4 Unemployment Rate

The unemployment rate is the proportion of the unemployed population to the total Labour force. According to the 19th International Conference of Labour Statistics (ICLS) of the ILO, a person is considered unemployed if they;

- a) Had no work from which they derive some income,
- b) Had taken active steps to look for employment and
- c) Were willing to be employed if an employment opportunity had presented itself.

Unemployment rate was 12.3% among persons aged 15 and above with a higher share among females (14.2%) than males at 10.5% (**Figure 10.5A**). National context analysis showed that 1.4 million (12.6%) of the population aged 14-64 years were unemployed with a higher rate for females (14.5%) than males (10.7%) (**Table 10.5**).

Regional disaggregation shows that Bukedi and Madi sub Regions had the highest unemployment rate (19.0% each), while Ankole sub Regions had the lowest at 8.2 percent among persons aged 14-64 (**Figure 10.5B**). Table 10.5 shows details among persons aged 15 and above.

Figure 10.5A: Unemployment Rate among Persons aged 15+ by sub Region

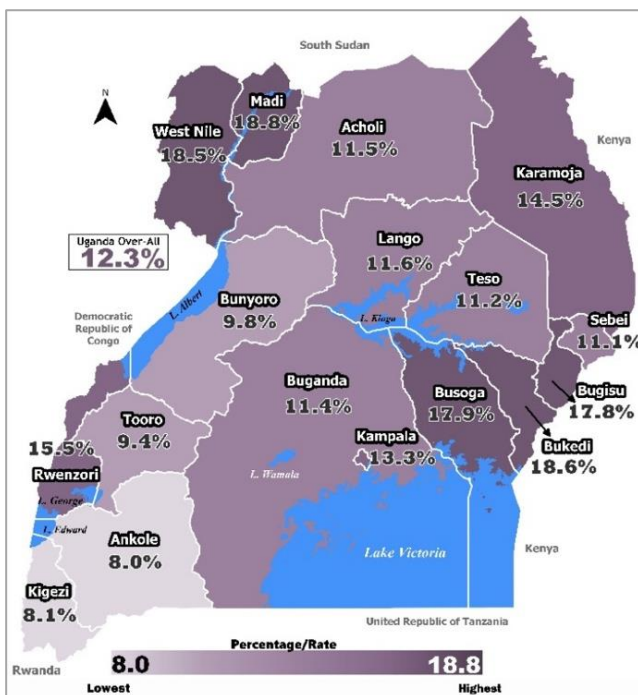

Figure 10.5B: Unemployment Rate among Persons aged 14-64 by sub Region

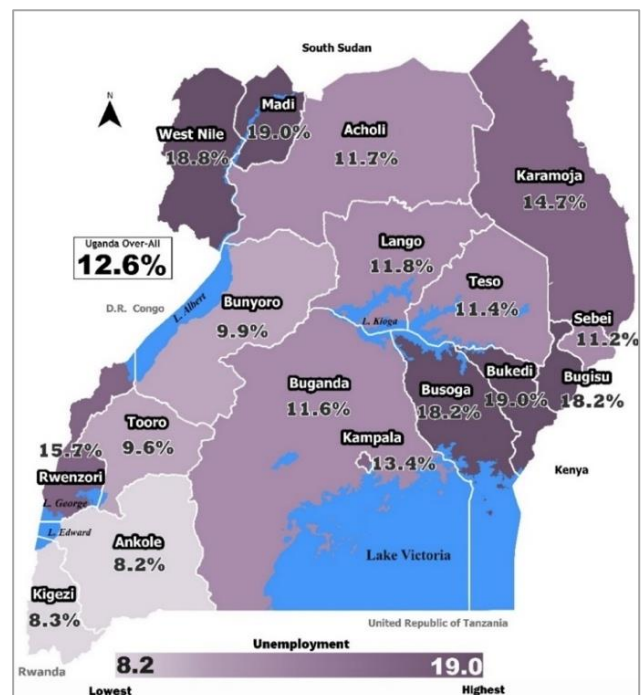

Figure 10.6 shows that 16.7 percent of the youth (15-24 years) were unemployed. Youth unemployment rate was higher among females (18.7%) compared to males (14.7%). Education attainment differentials showed that the highest youth unemployment rate was among persons who had completed secondary level of education (22.6%) as shown in **Table 10.5**.

Figure 10.6: Youth Unemployment Rate by sex

10.5 Long Term Unemployment

Long term unemployment refers to persons who have been unemployed for one year or longer but seeking and available for work or start a business.

More than half (50.9%) of the unemployed population aged 15 and above had been looking for work or trying to start a business and available for work for over one year (long term unemployment. (**Figure 10.7**))

Disaggregation by sub Region shows that Bukedi sub Region had the highest share (63.2%) of unemployed population aged 15 and above who had been looking for work or trying to start a business and available for work for over one year while Tooro sub Region had the lowest at 43.7 percent (**Table 10.6**).

Table 10.6 provides details on long term unemployment among persons aged 14-64.

Forty five percent of the unemployed youth aged 15-24 had been looking for work or trying to start a business for over one year (**Figure 10.8**).

Based on national context, 48.8 percent of the unemployed youth, aged 18-30, had been looking for work or trying to start a business for over one year (**Figure 10.8**).

Figure 10.7 Percentage of the unemployed in Long Term Unemployment by Sex

Figure 10.8 Percentage of unemployed Youth in Long Term Unemployment by Sex

Disaggregation by sub Region shows that Bukedi had the highest percentage (57.0%) of youth aged 15-24 who had been jobless or without doing work for pay or profit for one year while Kampala Capital City had the lowest at 38.3 percent (Table 10.6).

10.6 Potential Labour Force

Potential Labour Force (PLF) refers to persons not in employment who expressed an interest in working for pay/profit but for whom existing conditions limit either their active job search or their availability to work. This represents the population that was outside the Labour Force but expressed desire for employment despite limiting factors for search or availability expressed as a proportion of the extended Labour force (19th ICLS of the ILO)

Findings (Figure 10.9) show that the rate of Potential Labour Force among persons aged 15 and above was 14.2 percent representing a population of 1,824,329 persons. The rate of potential labour force was higher among females (16.8%) than males (11.5%). A similar pattern is observed among persons aged 14-64years. Table 10.7 provides details for persons aged 14-64 by subregion, residence and education level attained.

Figure 10.9: Percentage of the Working Age Population in Potential Labour Force

Regional variations in the potential labour force within the working age population (15+ years) reveal that Madi sub Region had the highest (28.4%), while Ankole sub Region had the lowest (8.1%) (Figure 10.10A).

Figure 10.10A: Percentage of Potential Labour Force (15+ years) by sub Region

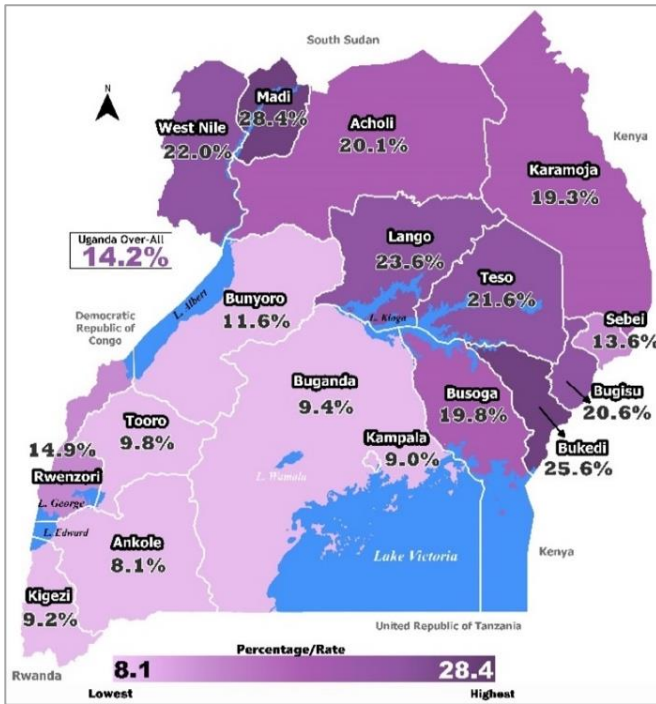

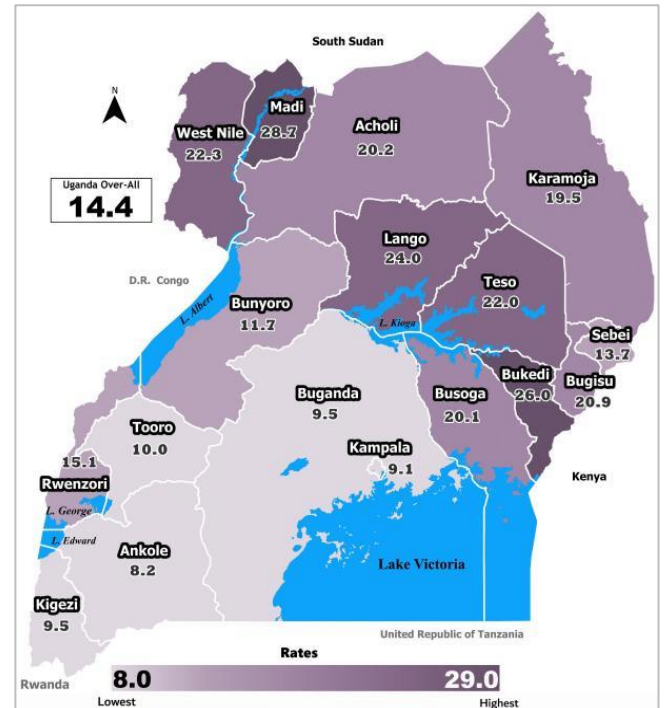

Figure 10.10B: Percentage of Potential Labour Force (14-64 years) by sub Region

Further analysis (Figure 10.11 & Table 10.7) shows that the Youth aged 15-24 in Potential Labour force was 18.5 percent. The rate was higher (20.9%) among females than males (15.9%).

Figure 10.11: Percentage of Youth in Potential Labour Force

Madi sub Region had the highest percentage (35.1%) of youth aged 15-24 in Potential Labour Force with Ankole having the least at 10.0 percent (Figure 10.12A and Table 10.7). A similar pattern is observed among youth aged 18-30 years.

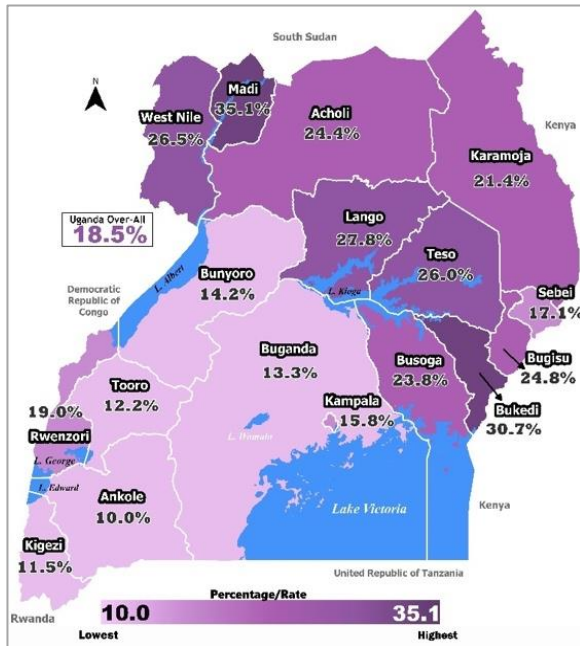

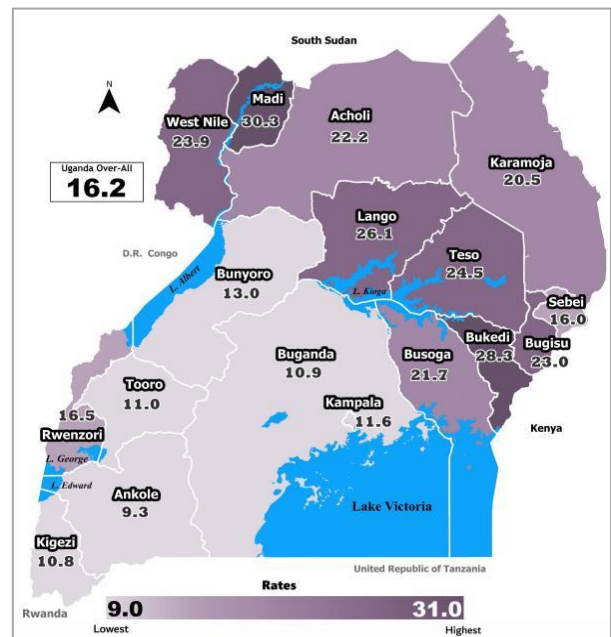

Figure 10.12B: Percentage of Youth (18-30 years) in Potential Labour Force by sub Region

10.7 Labour Force Participation Rate

Labour Force Participation Rate (LFPR) is the population in the labour force (employed and unemployed) expressed as a percentage of the working age population (19th ICLS of the ILO). It indicates the proportion of working age population that is active in the labour market as either employed or actively looking and available for employment. This indicator shows the relative size of the supply of labour available for production of market goods and services in the country.

The Labour Force Participation Rate (LFPR) was 43.2 percent among persons aged 15 and above with more males (49.0%) than females (38.6%) in the labour force. Kampala Capital City had the highest Labour Force Participation Rate at 62.6 percent while Madi sub Region had the lowest (24.5%) (**Table 10.8 & Figure 10.13A**). **Table 10.8 (A and B)** provides details on the LFPR among the Youth and Working age groups aligned to national and international definitions by sex, residence, education level attained and sub Region.

Figure 10.13A: Labour Force Participation Rate (15+ Years) by sub Region

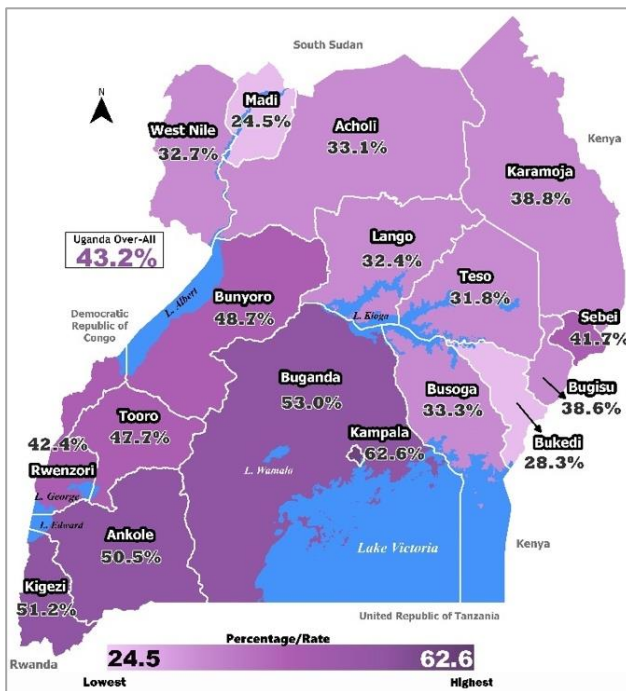

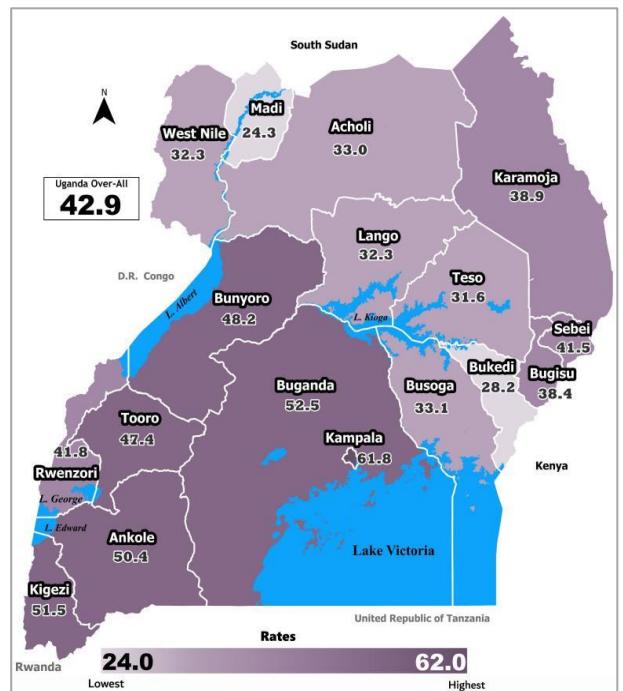

Figure 10.13B: Labour Force Participation Rate (14-64 Years) by sub Region

The Labour force Participation Rate among Youth aged 15-24 was 33.0 percent; with males having the highest percentage (34.8%) compared to females (31.3%). (Figure 10.14)

Regional disaggregation among the youth (15-24 years) shows that Kampala Capital City had the highest LFPR (43.1%) while Madi sub Region had the lowest at 15.9 percent.. Table 10.8A and Table 10.8B provides details by sex, residence and sub Region.

Figure 10.14: Youth Labour Force Participation Rate by Sex

10.8 Activity Status of the Youth

Activity status on the youth was classified into four categories i.e. Youth in Education; Youth in Employment and no longer attending School; Youth in Employment and attending School; and Youth Not in Employment, Education or Training (NEET).

Youth Not in Employment, Education, or Training (NEET) refers to those youth who are not engaged in any form of employment, formal education, or vocational training. NEET is often used as an indicator to measure the socio-economic challenges faced by youth, as it highlights those who may be disconnected from opportunities, for personal and professional development (ILO). In other word, these are the youth, who are idle and disconnected from the economic opportunities.

Four in every ten (42.6%) of the youth, aged 15-24 were NEET; 22.7 percent were in employment only while 4.7 percent were in employment and schooling and 30 percent were in school only (**Figure 10.15**). Five in ten (44.8%) of the youth NEET resided in the rural areas (**Table 10.9A**).

Figure 10.15: Percentage Distribution of Youth by activity status

Karamoja sub Region had the highest (57.1%) youth (15-24 years) NEET while Kigezi had the lowest at 31.4 percent (**Figure 10.16A and Table 10.9A**). **Figure 10.16B** shows the share of Youth (18-30 years) NEET with a detailed analysis provided in Table 10.9B.

Key Findings

- **Occupancy Tenure of dwelling units:** Sixty-six percent of households were living in owner-occupied dwellings, while 24.8 percent lived in rented dwellings.
- **Type of dwelling units:** Twenty-four percent of households lived in semi-detached dwellings, and 20.5 percent lived in huts.
- **Construction material:** Seventy-five percent of households lived in dwelling units with roofs made of iron sheets and 60.7 percent lived in dwellings with walls made of bricks. Thirty-one percent of households lived in dwellings with cement-screed floors.
- **Source of water for drinking:** Eight in every ten (81.1%) of households had access to an improved water source for drinking. Seven in every ten (70.0%) of households were within one kilometer from an improved water source.
- **Sanitation:** Four in every ten (43.6%) households had improved sanitation facilities, while 6.7 percent had no sanitation facility. Three in ten (28.3%) of households used shared toilets.
- **Energy for cooking:** Four out of every one hundred (3.8%) households used clean energy and technology for cooking.
- **Energy for lighting:** Seven in every ten (75.5%) households used clean energy for lighting.
- **Electricity:** Fifty-three percent of households used electricity (grid or solar) for lighting (25.3% - grid electricity and 28.1% - solar)

Housing is a basic human right, essential for the well-being of all mankind. It is one of the basic human needs that have a profound impact on the health, welfare, social attitudes and economic productivity of the individual. SDG 11 emphasizes the importance of ensuring access to safe, affordable, and adequate housing.

11.1 Housing Conditions

The NPHC 2024 collected data on the characteristics of households and the conditions of the dwelling units they lived in. These characteristics of dwellings and various aspects of households' living arrangements provide an important indication of the well-being of household members. The information included occupancy tenure, number of rooms used for sleeping and the main construction materials that were used for roof, floor and wall of a dwelling unit. Information was also collected on other household characteristics including, main source of energy for cooking and lighting, main source of drinking water, type of sanitation facilities, availability of household assets and solid waste management in the households

11.1.1 Occupancy Tenure

Occupancy tenure is defined as the arrangements under which the household resides in the dwelling. The arrangements include owner occupancy, renting of dwelling, subsidized dwelling or free dwelling.

Free dwellings included both free public and free private housing. Occupancy tenure of a dwelling unit has implications on security of tenure of the household. The results in **Table 11.1** show that overall, 65.8 percent of households (7,035,853) lived in dwelling units that they owned and 24.8 percent of households (2,654,721) lived in rented buildings.

Most households that lived in owner-occupied dwelling units were in rural areas (77.2%) compared to those in urban areas (49.0%) (**Figure 11.1**).

The biggest proportion of households that lived in rented dwelling units (41.7%) were in urban areas compared to those in rural areas (13.3%).

Teso Region had the most owner-occupied dwelling units (83.2% each) and Kampala Capital City had the least owner-occupied dwelling units (15.3%).

Kampala Capital City had the most rented dwelling units (70.0%) while Karamoja and Madi had the least (6.1% each) (**Table 11.1**).

Figure 11.1: Percentage of Occupancy Tenure of Dwelling Unit by Residence

11.1.2 Characteristics of Dwelling Units

Findings indicate that 24.1 percent of the dwelling units were semi-detached, 20.5 percent were huts and 19.6 percent were tenement (muzigo). A higher proportion of female headed households (21.4%) were in tenement (muzigo) compared to male headed households (18.7%) (**Table 11.2**).

Thirty three percent of households in urban areas lived in tenements (muzigo) compared to 10.6 percent in rural areas. Fifty five percent of households in Kampala lived in tenements (muzigo) compared to 1.0 percent that lived in huts. Notably, Karamoja had the highest proportion of households (79.0%) that lived in huts (**Table 11.2**).

11.1.3 Construction Materials of Dwelling Units

The type of materials used to construct the household's dwelling unit gives a general picture of the structural condition of the building based on durability and permanency of the materials and provides a general indication of the socio-economic status of the household. Findings in **Table 11.3** shows that overall, 74.7 percent of the households lived in dwelling units with roofs made of iron sheets, while 20.4 percent lived in units with thatched roofs.

Kigezi sub Region had the highest percentage (97.7%) of households whose dwelling units had iron sheets while Karamoja had the lowest (14.6%). Karamoja had the highest percentage of households with thatched roofs (74.6%) while Kigezi had the lowest (0.6%) (**Table 11.3**).

Good quality wall materials ensure household members are protected from harsh weather conditions and from exposure to hazardous factors. The distribution of households by construction material of the wall reveals that 60.7 percent of households lived in dwelling units with walls made of bricks while 21.2 percent of households were living in units with walls made of mud and wooden poles.

Considering the construction materials of the floor, the results in **Table 11.3** show that, 31.2 percent of households lived in dwelling units with cement screed floors.

11.1.4 Measures of Overcrowding

Crowding or housing density is a key measure of housing quality. The three most commonly used measures of crowding are persons per room, floor space per person and households per dwelling unit (United National Development Group, 2003).

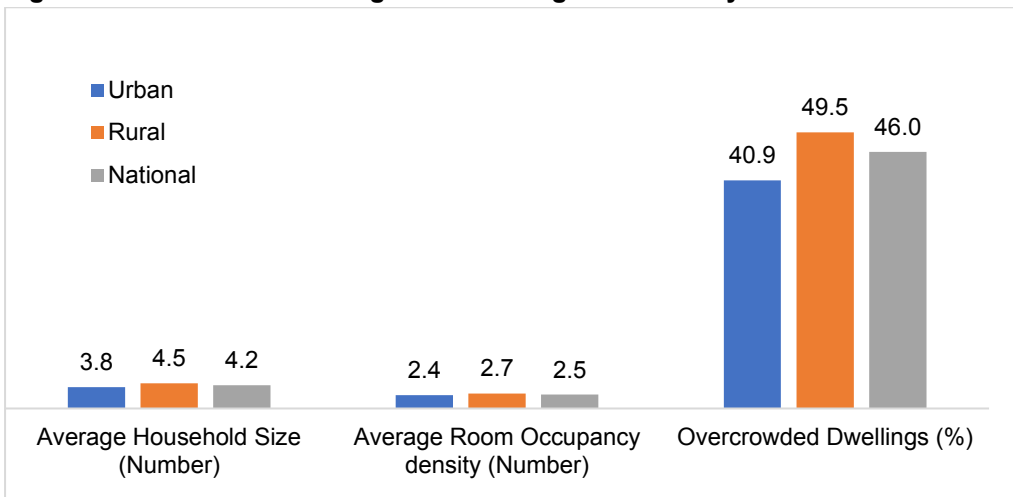

In this measure, a household is **overcrowded** if three or more persons sleep in one room.

The number of sleeping rooms provides an indication of the extent of crowding in households. Overcrowded rooms have health implications arising from, among others, disturbed sleep. More importantly, crowded living conditions increase the risk of the spread of infectious diseases.

Figure 11.2 presents some overcrowding indicators. The room occupancy density is the average number of people per room used for sleeping. Overall average room occupancy density was three (3) persons per room. Forty six percent of households were overcrowded, with more in the rural (49.5%) than urban (40.9%) areas.

The proportion of overcrowded dwellings reduced from 55.9 percent in 2014 to 46.0 percent in 2024 (**Table 11.4**).

Figure 11.2: Selected Housing overcrowding indicators by Residence

11.2 Household Sanitation and Hygiene

Proper sanitation is very crucial to the health of a population. The Sustainable Development Goal (SDG) 3 of “Good Health and Well Being” stresses the need for good sanitation and easy access to health services for all, hence universal access to good sanitation is a key priority of the Government of Uganda.

The World Health Organization (WHO) defines household sanitation as the provision of facilities and services for safe disposal of human waste as well as garbage.

The NPHC 2024 collected information on the source of water for drinking, types of toilet facilities used by households and solid waste disposal. This information is presented in this chapter to study sanitation and health characteristics of the households and the individuals staying in these households.

11.2.1 Main Source of Water for Drinking

Access to safe water and good sanitation is very crucial to the health of a population. Unimproved water sources and poor sanitation increase the risk of water borne diseases and illnesses due to poor hygiene causing a burden on service delivery through increased demand for health care.

During the NPHC 2024, information on the main source of water for drinking and distance to main source of water for drinking were used as the proxy indicators for access to safe water in a household.

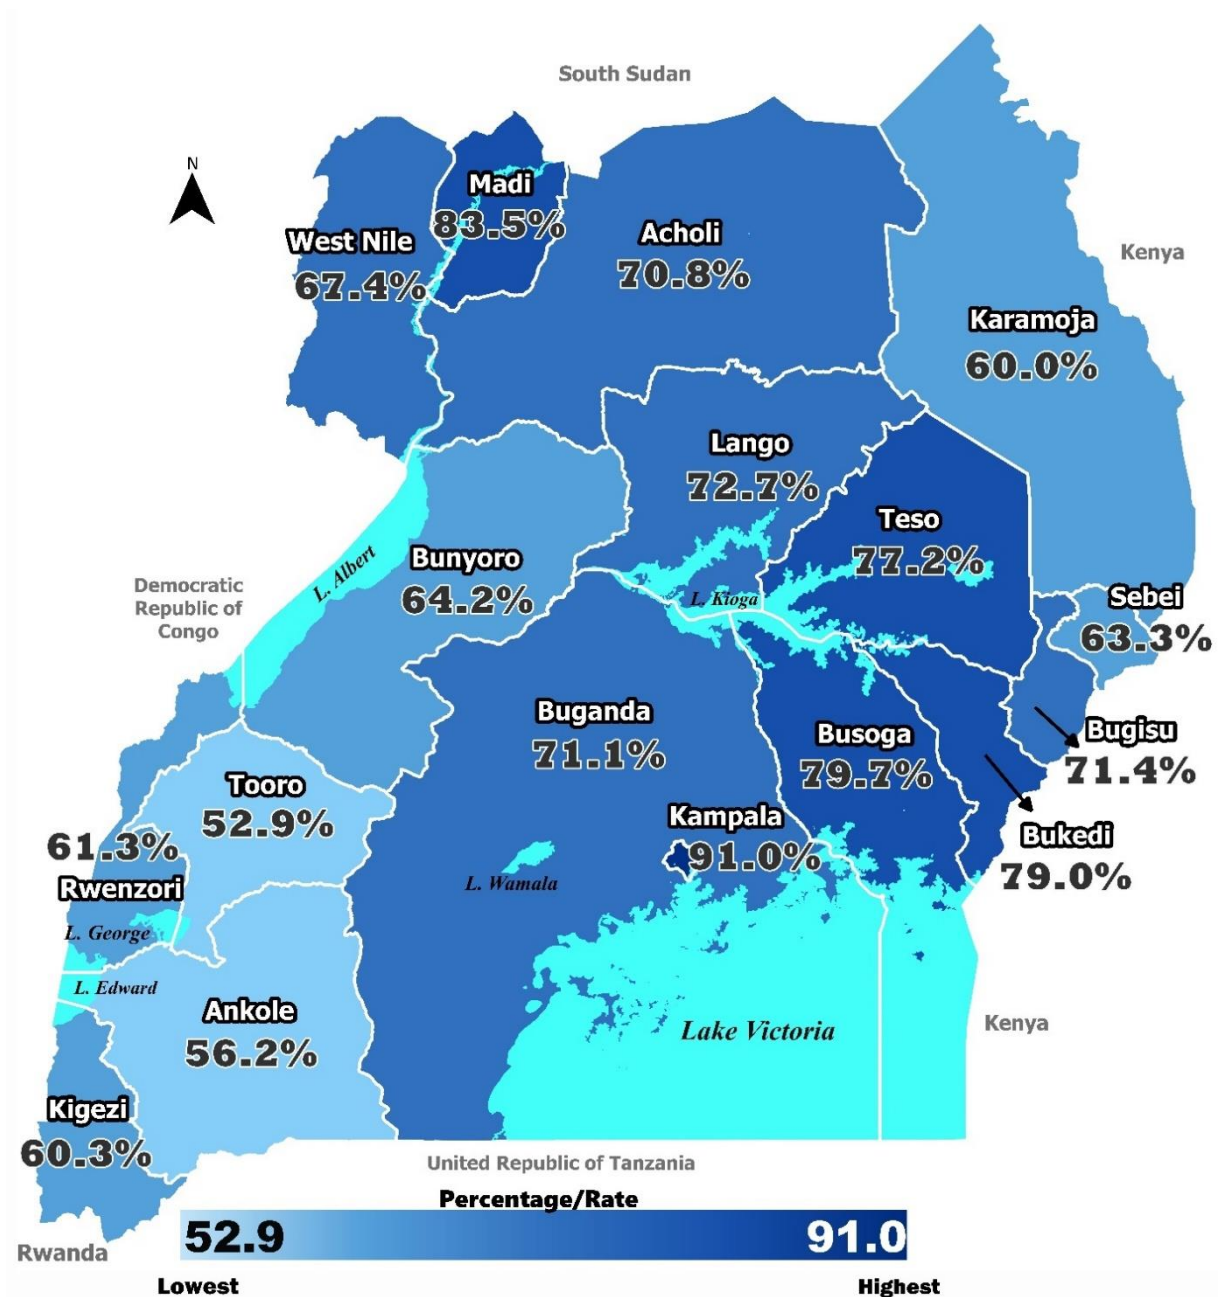

Improved drinking water sources are those that, by nature of its construction or through active intervention, is likely to be protected from outside contamination (UNICEF). Unimproved drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development.

The NPHC 2024 defined improved water sources to include: piped water, boreholes, protected springs, rainwater and unimproved drinking water sources included unprotected well/spring, vendor, tanker truck, bottled water and river/lake.

Results in **Table 11.5** shows that 81.1 percent of households had access to improved water source for drinking while 18.9% had access to unimproved water sources. Variations in residence show that 86.6 percent of households in urban areas had access to improved water source compared to 77.4 percent in rural areas. The results further reveal that 39.2 percent of the households used the borehole as their main source of drinking water and this was higher in rural areas (48.9%) compared to urban areas (25.0%) (**Table 11.5**).

One of the barriers to the use of safe water is the long distances to the sources. **Figure 11.3** shows that 70.0 percent of households were within less than one kilometre from an improved water source (basic water services). Kampala Capital City had the highest percentage of households (91.0%) within one kilometer from an improved water source while Tooro sub Region had the lowest (52.9%) (**Figure 11.3**). Overall, 24.1 percent of households have their water source on premise while 13.9 percent households move 1Km-5Kms to the water source (**Table 11.5**).

Figure 11.3: Proportion of Households within one Km from an Improved Drinking Water Source

11.2.2 Type of Toilet Facility used

The World Health Organization underpins safe disposal of human waste as one of key measures to reduce diarrheal disease transmission.

Basic sanitation is defined as an improved toilet facility that is not shared with any other household and limited sanitation was defined as an improved facility that was shared with another household. Improved toilet facilities include the flush toilets, VIP latrines, covered pit latrines with a slab and Ecosan.

Table 11.6 shows the distribution of households by type of toilet facility used and selected background characteristics. Two in ten (24.6%) of households used a covered pit latrine without a slab as their main toilet facility.

The percentage of households with improved sanitation facilities was 43.6 percent compared to 49.7 percent of households with unimproved sanitation facilities (**Figure 11.4**). Seven percent (6.7%) of households had no sanitation facility (open defecation).

Sebei sub Region had the highest proportion (40.9%) of households that used a covered pit latrine without a slab compared to Kampala Capital City that had the lowest (8.4%) (**Table 11.6**).

The proportion of improved sanitation facilities was higher (60.9%) among households in urban areas compared to 31.8 percent among households in rural areas. There were more households in rural areas (9.2%) with no facility compared to 3.0 percent in urban areas. Results in **Table 11.7** show that the proportion of households that had shared toilet facilities regardless of whether they were improved or unimproved was 28.3 percent (**Figure 11.4; Table 11.7**).

Karamoja had the highest proportion of households with no facility (60.2%) while Kampala Capital City (0.5%) had the lowest (**Figure 11.5**)

Figure 11.4: Percentage Distribution of Households by Type of Toilet Facilities

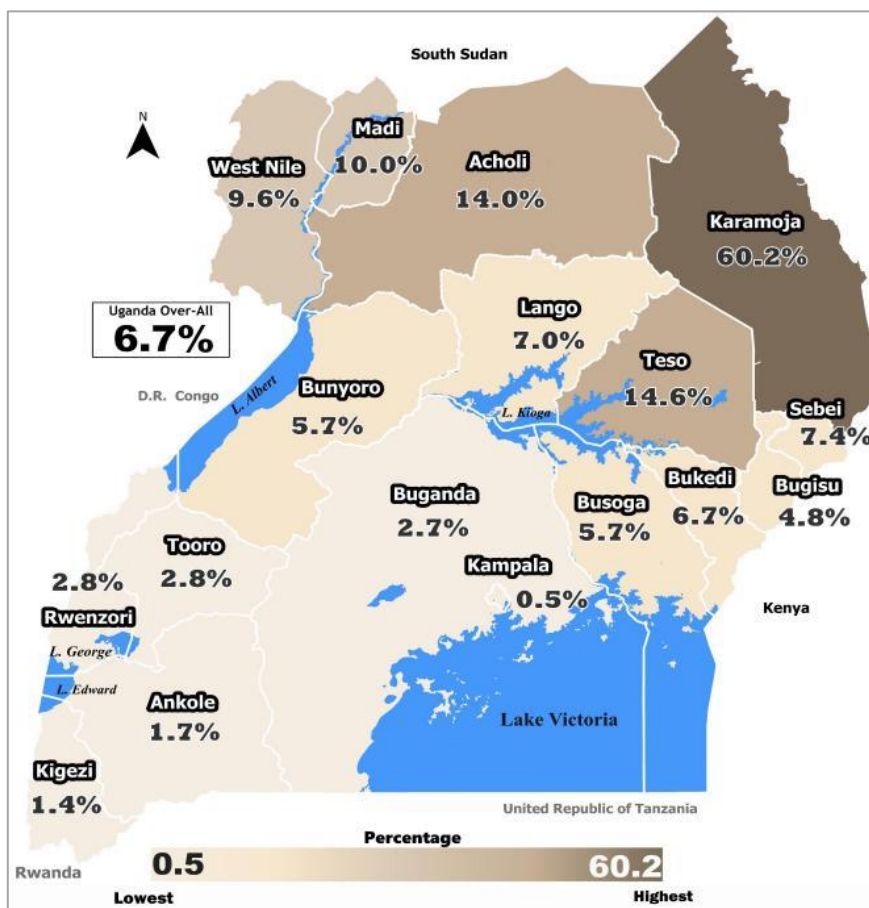

Figure 11.5: Percentage of Households without a toilet facility by sub Region

11.2.3 Handwashing

Handwashing after toilet use protects against communicable diseases. Availability of handwashing facilities at or near the toilet can be used as a proxy measure of hygiene after toilet use. SDG 6 Target 6.2 aims to achieve access to adequate and equitable sanitation and hygiene for all and end open defecation. Indicator 6.2.1: Proportion of population using safely managed sanitation services, including a handwashing facility with soap and water, is used to monitor progress towards this goal.

Table 11.8 provides information on availability of handwashing facilities in households and the use of water and soap. Overall, 47.1 percent of households had a handwashing facility next to the toilet. Ten percent (10.3%) of households had handwashing facilities with water only, 24.3 percent had facilities with water and soap while 12.5 percent did not have water and soap.

Kampala Capital City had the highest proportion of households that had handwashing facilities (58.3%) while Teso had the lowest proportion of households with handwashing facilities (30.1%) (**Table 11.8**).

11.2.4 Bathrooms

The NPHC 2024 sought for information on the type of bathroom the household mainly used. Results in **Figure 11.6** shows that, three in every ten households (33.4%) used outside built bathrooms with drainage while 8.6 percent of the households had no bathroom facility.

Figure 11.6: Percentage Distribution of Households by type of Bathroom

More households in the urban areas had outside-built bathrooms with drainage provided (40.8%) compared to rural areas (28.4%).

Teso sub Region had the highest proportion of households using makeshift type of bathroom (26.7%). Karamoja sub Region had the highest proportion of households with no bathroom (43.7%) (Table 11.9).

11.3 Household Energy Consumption

Electricity is one of the basic necessities of modern living. The use of clean energy and renewable energy sources would reduce the reliance on wood fuel for cooking and ultimately protect natural resources. Clean power would improve the health of women through reduced exposure to smoke from wood fuels.

SDG 7 requires member states to ensure access to affordable, reliable, sustainable and modern energy for all. Both the National Development Plan III and Uganda's Vision 2040 recognize that energy and in particular, electricity is a driver of socio-economic transformation of a nation. The government's policy vision for renewable energy is to make modern renewable energy a substantial part of the national energy consumption.

11.3.1 Source of Energy for Lighting

The main source of energy for lighting is an important indicator in assessing quality of housing welfare or households. Findings in Figure 11.7 show that overall, 75.5 percent of households used clean energy for lighting.

The proportion of households using clean energy for lighting was higher in urban areas (82.8%) compared to those in rural areas (70.4%) (Figure 11.7).

Figure 11.7: Percentage of Households using Clean Energy for Lighting by Residence

Findings show that solar was the main source of lighting in households (28.1%) and the least used source of energy for lighting was Liquefied Petroleum Gas (LPG) lamp (2.4%) (Figure 11.8).

Figure 11.8: Main source of energy for lighting (Percentage)

*Others include biogas lamp, gasoline and other sources of energy for lighting

Overall, 25.3 percent of households had electricity (grid) for lighting, and 28.1 percent of households used solar energy for lighting. (Figure 11.9, Figure 11.10, and Table 11.11).

Figure 11.9: Percentage Distribution of Households using Electricity (grid) for Lighting

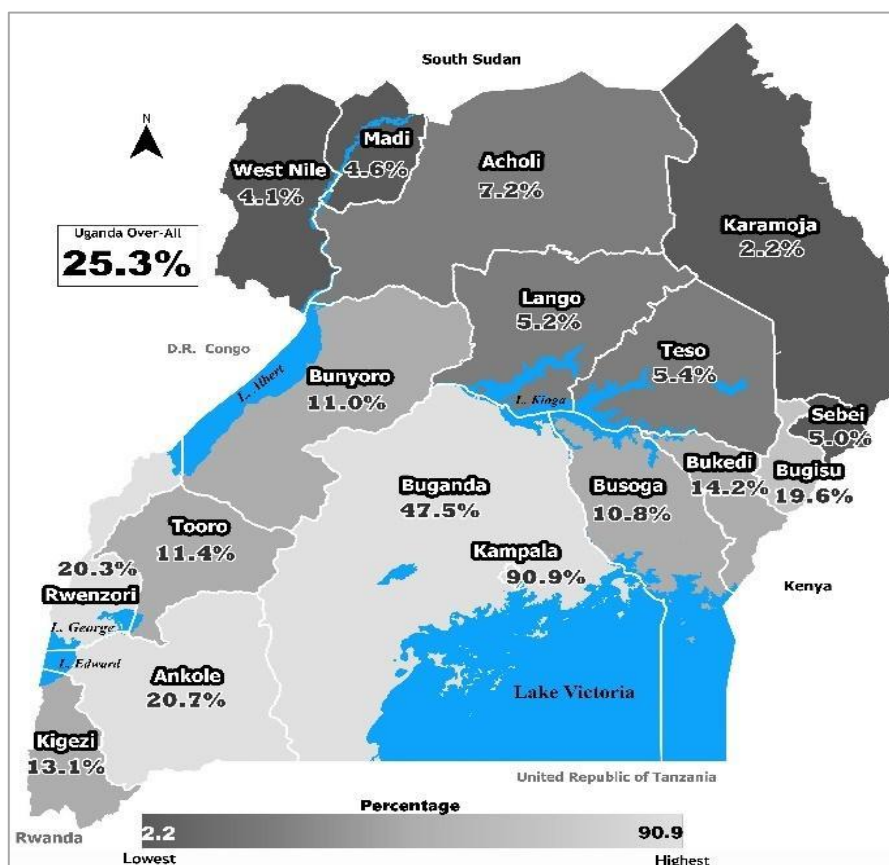

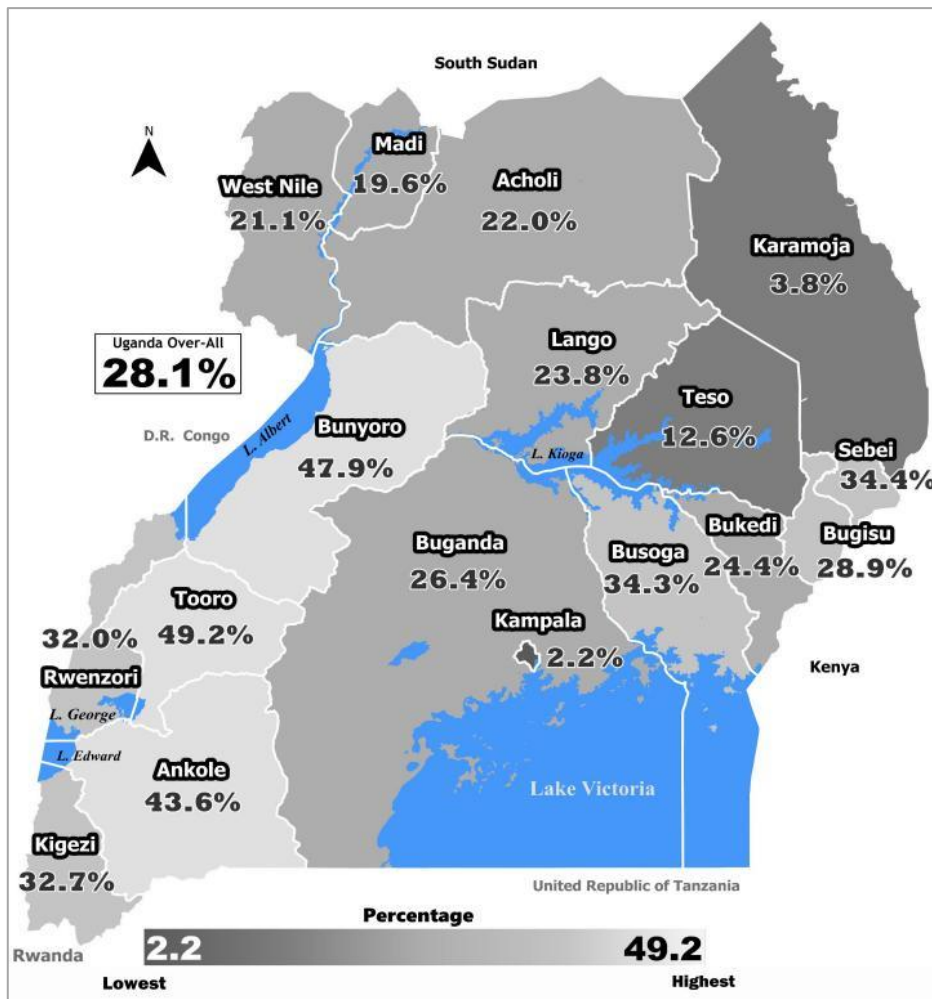

Figure 11.10: Percentage Distribution of Households using Solar for Lighting

11.3.2 Source of Energy for Cooking

The sources of energy and technology used for cooking may impact on the health status of household members and the environment around them. The Government through the Ministry of Energy and Mineral Development (MEMD) is promoting the use of efficient cooking technologies so as to reduce the pressure on the trees and forest resources, reduce pollution and save financial resources of households. Overall, 3.8% of households were using clean fuel and technology for cooking (Figure 11.11).

Seven percent (6.5%) of households in urban areas used clean fuel and technology for cooking as compared to two percent (1.9%) of those in rural areas. (Figure 11.11)

Figure 11.11: Percentage Distribution of Households using Clean Fuel and Technology for Cooking

11.3.3 Household Kitchen Type

The place where cooking is done, coupled with the type of fuel and stove used, influences indoor air quality and the degree to which household members are exposed to the risk of respiratory infections and other diseases.

Information was gathered on the types of kitchens and cooking stoves used for cooking by the household members. A kitchen located inside the dwelling unit that uses wood fuel is a health hazard to the inhabitants of the dwelling because of the high chances of inhaling smoke.

The findings in **Table 11.12** show distribution of households by the main cooking stove used. Sixty percent (59.5%) of the households that reported to cook, used three stone stoves for cooking. **Table 11.13** summarises the distribution of households by type of kitchen. At national level, 42.3 percent of households used an outside built kitchen, in a separate room, 30.4 percent did their cooking in open space. Forty seven percent (47.2%) of households in rural areas had outside built kitchen, in a separate room as compared to 35.0 percent in urban areas.

Karamoja had the highest proportion of households cooking in open spaces (58.5%) while Sebei had the lowest (13.6%). Acholi subregion had the highest percentage of households cooking in a main house without a separate room (25.5%) while Kigezi and West Nile had the lowest (3.6% each) (**Table 11.13**).

11.3.4 Main Source of Fuel for Cooking

The dependence on wood fuel for cooking impacts negatively on the health of the person using it and the environment. The results in **Figure 11.12** show that the biggest percentage of households that reported to cook used firewood as their main source of energy for cooking (65%) while the lowest percentage reported to use kerosene/paraffin (0.8 percent)

Table 11.14 shows that the use of wood as the main source of fuel for cooking was highest among households in rural areas (80.0%) compared to 41.2% in urban areas. On the other hand, the highest percentage of households in urban areas (48.6%) used charcoal as their main source of fuel for cooking compared to 14.7% in rural areas.

Figure 11.12: Percentage Distribution of Households by Main Source of Fuel for Cooking

List Of Tables

For more information on household characteristics, see the following tables and Annex Table A5

The total number of households is taken for only households that reported to be cooking

Key Findings

- **Households in Money economy:** There were 7.2 million households in the money economy, accounting for 66.9 percent, whereas 3.5 million households (33.1%) were in subsistence economy.
- **Households that benefited from Parish Development Model funds (PDM):** Of the 3,543,400 households in subsistence economy, 832,746 households (23.5%) reported to have benefited from the Parish Development Model in last 12 months prior to the Census.
- **Ownership of clothing and shoes:** Sixty-nine percent of the households reported all members in a household having at least one pair of shoes and at least two sets of clothing.
- **Ownership of land:** Seventeen percent of the population own land. Thirty percent of the population aged 18 and above own land. More than half (58%) of adults (18 years and above) who own land have a title deed or legal documentation registered in their name.

Effective governance and social development are critical for improving the well-being of citizens. The Government of Uganda has implemented development programmes aimed at addressing the social and economic wellbeing of Ugandans.

12.1 Households that Benefitted from Parish Development Model

The Parish Development Model (PDM) is the last mile strategy for service delivery by Government of Uganda for improving incomes and welfare of all Ugandans at the household level (MoLG, 2017). The Parish Development Model (PDM): Is a community development approach focused on empowering local communities in rural areas to identify and address their specific needs through participatory decision-making processes and collaboration with various stakeholders. The model aims to enhance the overall well-being and quality of life in rural areas by addressing social, economic, environmental, and cultural aspects of development in an integrated manner.

Households were asked whether they had benefited from the Parish Development Model programme by the time of the Census.

The households that reported to have benefited from Parish Development Model were 832,746.

Majority of the households that reported to have benefited from PDM were male headed households (628,561) as compared to the female headed households that were 204,185 (Figure 12.1 & Table 12.1)

Figure 12.1: Number of Households that benefited from PDM by sex of the Household Head

12.2 Beneficiaries of Other Government Programs

The NPHC 2024 collected information about the population 18 years and above who had ever benefited from any Government programmes twelve months prior to the census enumeration and the results are as presented below.

- EMYOOGA programme:** The Government of Uganda launched an initiative aimed at transitioning the 68.9% of households currently engaged in subsistence farming into a money-driven economy with a focus on market-oriented production. **Figure 12.2** shows that less than one percent (0.4%) of households had at least one household member who had received the EMYOOGA funds.
- The Social Assistance Grants for Empowerment (SAGE).** This grant targets persons aged 80 and above. **Table 12.2** shows that SAGE had the highest percentage of beneficiaries of a Government programme at 17.6% percent. This means that 17.6 percent of the household population aged 80 and above have ever received the grant.
- National Agriculture Advisory Services (NAADS).** The overall goal of NAADS interventions is to contribute to increased commercialisation and competitiveness of agricultural production, value addition and agro-processing for improved household food security and incomes. **Figure 12.2** shows that NAADs programme had less than one percent (0.9%) of overall beneficiaries. More males (1.0%) than females (0.8%) benefited from this programme (**Figure 12.2 and Table 12.2**).
- Special Enterprise Grant for Older Persons (SEGOP) aged 60-79 years.** The grant is to provide financial support to older persons for income generation. **Figure 12.2** shows that seven percent (6.7%) of the targeted household population (60-79 years) benefited from SEGOP.
- Operation Wealth Creation (OWC)** is a government intervention to efficiently facilitate national socio-economic transformation, with a focus on raising household income and wealth creation by transforming subsistence farmers into commercial farmers to end poverty. This question was asked to the population aged 18 and above. **Figure 12.2** shows that less than one percent (0.4%) of the household population benefited from OWC.

- **The Youth Livelihood Programme (YLP)** The Programme Development Objective is to empower the target youth to harness their socio-economic potential and increase self-employment opportunities and income levels. The target population is persons aged 18 to 30 years. **Figure 12.2** shows that less than one percent (0.4%) of the targeted household population (18-30 years) benefited from YLP.
- **The Uganda Women Entrepreneurship Programme (UWEP)** is an initiative of the Government of Uganda that is aimed at improving access to financial services for women and equipping them with skills for enterprise growth, value addition and marketing of their products and services. **Figure 12.2** shows that less than one percent one percent (0.5%) of women aged 18 and above (household population) had received the grant.

Figure 12.2: Persons who benefited from the various Government Programmes in the last 12 months prior to the Census (Percentage)

12.3 Households in Subsistence and Money Economy

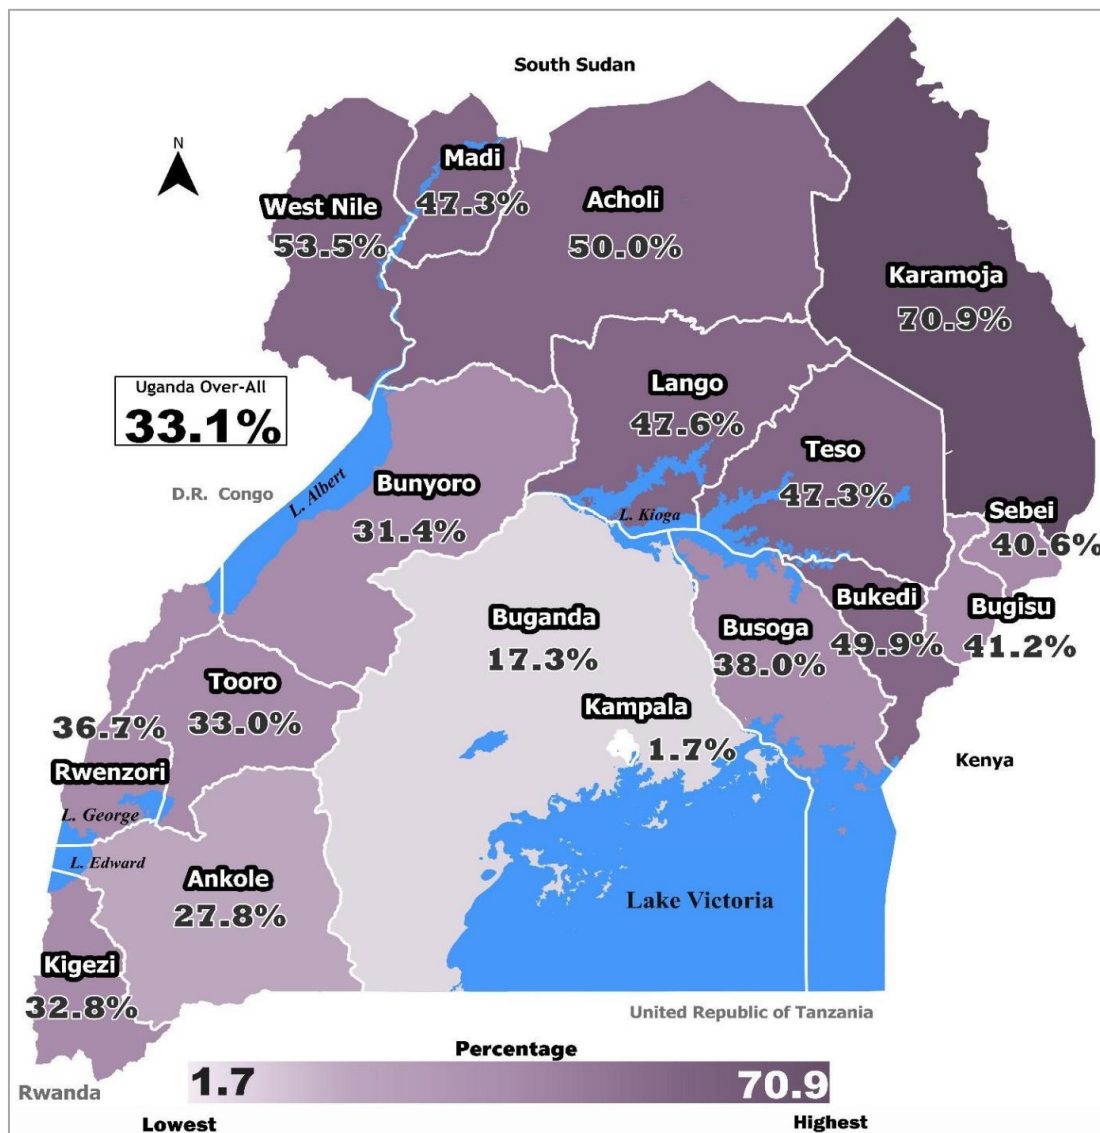

Households within the subsistence economy are those unable to satisfy their basic needs. Essential household requirements encompass both food and non-food items. The assessment of a household's capacity to fulfil these basic needs is crucial in identifying those within the subsistence economy. This category includes households involved in subsistence farming, those receiving wages that fall short of meeting basic needs, businesses generating insufficient returns, and households that are economically inactive and unable to meet their basic needs.

Conversely, households classified outside the subsistence economy belong to the money economy. These households are characterized by their ability to adequately meet their basic needs and remain with savings.

The findings indicated that one third (33.1%) were in the subsistence economy while two thirds of households (66.9%) were in the money economy (**Table 12.3**). Karamoja sub Region had the highest proportion at 70.9 percent while Kampala Capital City had the lowest (1.7%) (**Figure 12.3 and Table 12.3**). Table 12.4A shows characteristics of the households in subsistence or money economy.

In comparison with districts and cities (**Annex Table A4**); Kaabong district had the highest percentage of households (83.3%) in subsistence economy while Kampala Capital city had the lowest (1.7%).

Figure: 12.3: Percentage of Households in the Subsistence Economy by sub Region

12.4 Households in Subsistence Economy that Benefited from Parish Development Model

This section provides statistics on households engaged in the subsistence economy that benefited from Parish Development Model.

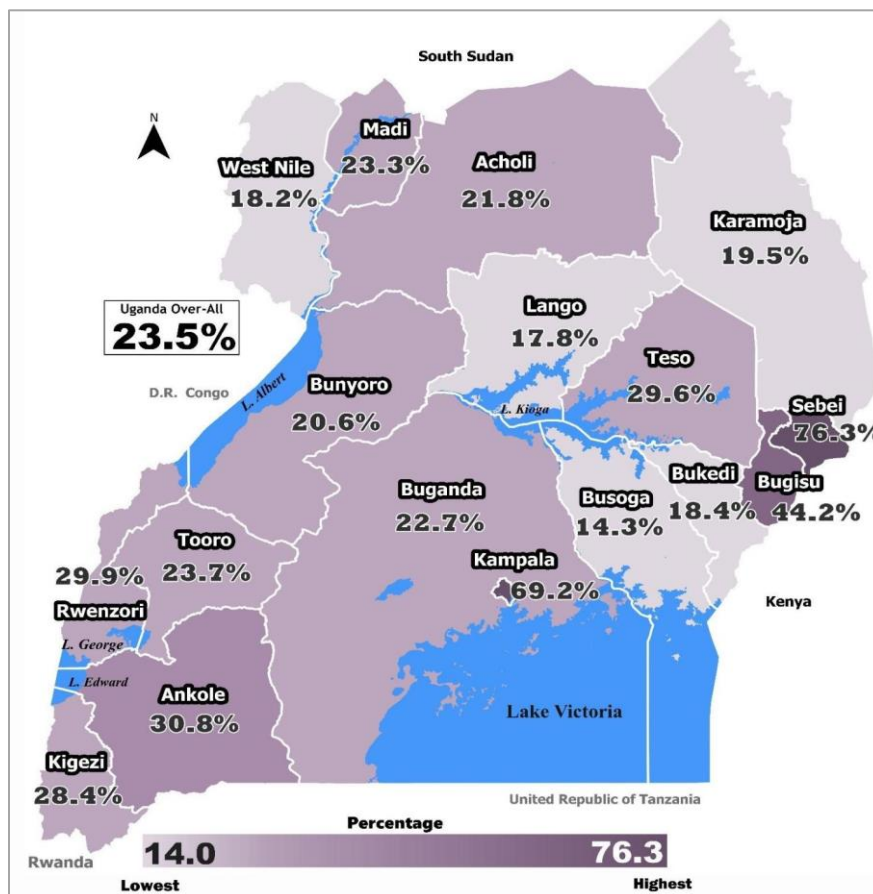

Overall, 23.5 percent of households in subsistence economy reported to have benefited from the Parish Development Model (Figure 12.4 & Table 12.3).

Figure 12.4: Percentage of Households in Subsistence Economy that benefited from PDM

Sebei sub Region had the highest proportion of households in subsistence economy that reported to have benefited in PDM at 76.3 percent whereas Busoga had lowest percentage (14.3%) (Figure 12.5).

Figure: 12.5: Percentage of Households in the Subsistence Economy that benefited from PDM by sub Region

12.5 Composition of Households In Subsistence and Money Economy

Eight in ten (75.9%) of households in the money economy were earning a wage or salary while 24.1 percent had an income-generating business enterprise. Three in every four households (74.5%) in the subsistence economy primarily relied on subsistence farming. Fifteen percent earned wages or salaries, while 10.4% were mainly involved in income-generating activities (**Figure 12.6 and Table 12.4B**).

Figure: 12.6: Percentage of Households in Subsistence and Money Economy

12.6 Household Welfare

Ownership of clothing, shoes, shelter and ownership of selected assets are some of the proxy indicators of household welfare.

12.6.1 Ownership of Clothing and Shoes

Seven in ten households (68.8%) had every member in the household owning at least one pair of shoes and at least two sets of clothing (**Figure 12.7**).

Karamoja sub Region had the lowest percentage of households where every member owned at least two sets of clothing (57.1%) and a pair of shoes (37.5%).

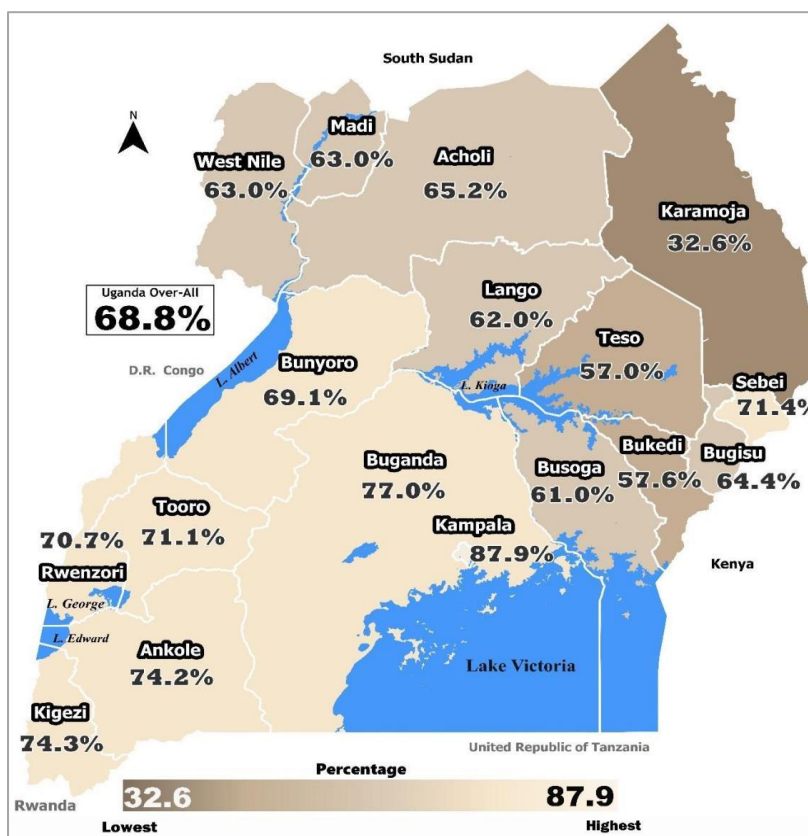

Male-headed households had a higher percentage (69.6%) of members owning both, at least a pair of shoes and at least two sets of clothing while female-headed households (67.4%). (**Table 12.5**)

Figure 12.7: Percentage of Households owning Clothing and Shoes

Kampala Capital City had the highest percentage of households that had every member of the household owning at least one pair of shoes and at least two sets of clothing (87.9%) while Karamoja sub Region had the lowest (32.6%) (**Figure 12.8**).

Figure: 12.8: Percentage of Households that had every member owning at least One pair of Shoes and at least Two sets of Clothing by sub Region

12.6.2 Ownership of Selected Household Assets

Ownership of assets such as household appliances, non-movable assets (house/dwelling unit, land), transport assets (bicycle, motorcycle/scooter, motor vehicle truck, motor vehicle saloon car, motor vehicle minibuss, motor vehicle bus) are some of the proxy indicators of household welfare. Assets can provide a safety net during times of crisis, enhance productivity, and generate additional income streams.

The percentage of households that had at least one member owning land were 47 percent. Of these 51.7 percent were male headed households while 37.8 percent were female headed households (Figure 12.9 and Table 12.6).

Figure 12.9: Percentage of Ownership of selected Household Assets

12.7 Ownership of Land and Legal Documentation at Individual Level

Land is a fundamental resource underpinning agriculture, housing, and industry, playing a key role in economic development and environmental sustainability. In Uganda, secure land ownership is pivotal for economic growth, providing the foundation for investment and productivity.

The UN 2030 Agenda for Sustainable Development, Goal 1, Indicator 1.4.2. *This indicator tracks the proportion of total adult population with secure tenure rights to land with legally recognized documentation.*

12.7.1 Ownership of Land

Information on ownership of land was obtained at individual level. Respondents were asked a question whether they own any agricultural or non-agricultural land either alone or jointly with someone else. Of the total population, 7,392,769 (16.7%) owned land.

Disaggregation by age groups showed that 50.6 percent of persons aged 60 years and above owned land, while less than four percent (3.9%) of children (10-17 years) owned land. (**Table 12.7**). Findings further show that 6,618,715 persons aged 18 and above owned land, whereas 15,616,273 do not own (**Table 12.8**). Among the adult males, 36.7 percent owned land and among the adult females, 24.4 percent owned land.

12.7.2 Ownership of Legal Land Documents

Findings show that 58.0 percent of the adult population who owned land had legal documentation.

Kampala Capital City had the highest proportion of person that have land with legally recognized documentation (81.1%) while Lango sub Region had the lowest (29.3%) (**Figure 12.11 & Table 12.11**). Whereas 6,618,715 (29.8%) of adult population owned land, only 3,836,860 (58.0%) had legal documentation.

Figure 12.10: Percentage of Individuals aged 18 years and above who Owned Land with Legal Documentation.

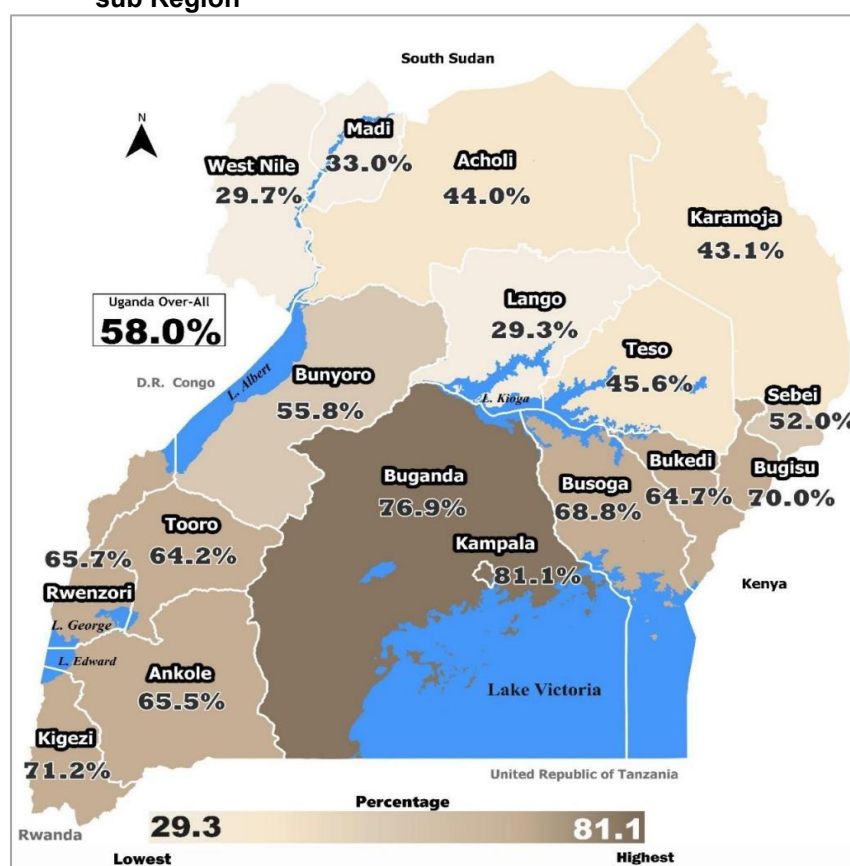

Figure 12.11: Percentage of Population aged 18 and above with Legal land Documentation by sub Region

Key Findings

- **Savers:** Forty three percent of the household population aged 16 and above had saved money in the last 12 months prior to the Census.
- **Saving strands:** Sixty four percent of savers used formal saving strands. More males (69.3%) used formal strands compared to females (59.6%).
- **Saving mechanisms:** Forty six percent of savers used mobile money, while two percent used credit institutions.
- **Access and Use of Mobile money services:** Forty one percent of the household population aged 16 and above had transacted using mobile money services in the last 30 days prior to the Census.

The NPHC 2024 collected information on the population with access and use to financial services in the last 12 months. This included savings and savings mechanisms, that is formal or informal institutions, and keeping money in the house or with a friend. The analysis was done for persons aged 16 and above. This section offers an overview of the current state of savings and mobile money usage in the country, exploring formal and informal financial institutions, as well as those using other methods (saving at home or with a friend).

Formal financial service providers – are financial services provided by formal financial service providers, e.g. commercial banks, microfinance institutions (including deposit-taking institutions), Savings and Credit Cooperative Organizations (SACCOs), credit institutions, cooperatives, mobile money service providers, insurance service providers, pension funds, capital markets, forex bureaus and money transfer institutions (such as Western Union and MoneyGram).

Informal financial services – are financial services provided by an institution or individual that is not regulated or supervised. e.g. savings groups, village savings and loan associations (VSLAs), rotating savings and credit associations (ROSCAs), Merry-Go-Rounds, investment clubs and community-based money lenders and burial societies. Family and friends are not regarded as informal service providers.

Saving service – provides the user with a means to put aside money for safe keeping

13.1 Uptake of Savings Services

A saving mechanism refers to the methods or tools individuals use to save money and manage their finances effectively using formal, informal and those using financially excluded methods. Household members were asked about the type of saving mechanisms used, 12 months preceding the NPHC 2024.

Figure 13.1 shows that 43.2 percent of the household population aged 16 and above had saved money in the last 12 months prior to the Census.

Figure 13. 1: Proportion of Persons aged 16 and above that Saved money

13.2 Saving Strands

The NPHC 2024 collected information on how persons aged 16 years and above used different saving strands. Figure 13.2 shows that 64 percent of the savers used formal saving strands. More males (69.3%) used formal saving strands compared to females (59.6%). More savers in the rural areas kept money at home or with a friend (24.5%), compared to those in urban areas (13.9%). (**Figure 13.2**)

The highest percentage of savers using formal strands had Post secondary and above education (91.2%), while the least had no formal education (46.4%). The highest percentage of savers using informal strands (22.8%) and keeping money at home or with a friend (30.8%) had no formal education while the least had post secondary and above (4.3% and 4.5%). Kampala Capital City had the highest proportion of savers using formal strands (88.4%), while Karamoja had the least (36.8%), Acholi sub Region had the highest percentage of savers using informal strands (31.0%), while Kampala Capital City had the least (3.2%). (**Table 13.1**).

Figure 13. 2: Percentage Distribution of Savers (16 years and above) by Saving strands

13.3 Uptake of Saving Mechanisms

Figure 13.3 shows that among the household population aged 16 and above, 46.3 percent of savers used mobile money, 39.6 percent kept cash at home or in a secret hiding and 28.9 percent used saving groups. Two percent of savers used Credit institutions, three percent used Investment clubs and 9.9 percent used MDIs. More men saved with mobile money (54.0%), commercial banks (20.3%) and SACCOs (11.7%) than women (40.0%, 11.8% and 10.6%), while more women saved with MDIs (13.5%) and Savings groups (32.8%) than men (5.4% and 24.1%).

Figure 13. 3: Savers by sex and Saving mechanism (Percentage)

Among the sub Regions, Kampala Capital City had the highest proportion of savers using mobile money (68.2%) and commercial banks (40.5%), while Karamoja sub Region had the least (26.8% and 6.6%). Karamoja sub Region had the highest proportion of savers who kept cash at home or in a secret hiding (57.9%), while Kampala Capital City had the least (25.0%). More savers in the urban areas used mobile money (56.3%), commercial banks (25.0%) and SACCOs (12.4%) than those in the rural areas (39.0%, 8.8% and 10.1%), while more savers in the rural areas used MDIs (10.6%) and Savings groups (33.4%) than those in the urban areas (8.9% and 22.6%) (**Table 13.2**).

13.4 Access and Use of Mobile Money Services

This section provides an overview of mobile money services in Uganda, highlighting its accessibility and usage.

Money services refer to electronic wallet solutions that allow users to send, receive, and manage money through mobile devices. These services enable financial transactions without the need for traditional banking infrastructure. Users can perform various functions, such as making payments, transferring funds, paying bills, and purchasing goods and services, all using their mobile phones. Mobile money helps bridge the gap for underserved populations, empowering them to save, invest, and manage finances effectively.

Table 13.3 shows that, 40.7 percent of the population aged 16 and above had transacted using mobile money services in the last 30 days prior to the Census.

Among them, 32.9 percent conducted transactions using their registered accounts, while four percent utilized agents or other registered mobile accounts (**Figure 13.4 and Table 13.3**).

Figure 13. 4: Percentage of Population (16 years and above) that made Mobile Money transactions 30 days to Enumeration.

List of Tables

Key Findings

- **Methods of solid waste disposal:** Nine in every ten (91.6%) households used improper methods of solid waste disposal.
- **Most commonly used method of solid waste disposal:** More than half of the households (51.2%) dispose solid waste in the rubbish pit (burn/bury), while 3.7 percent dispose into local dump supervised by urban authorities and 4.7 percent had solid waste collected by waste vendor.
- **Electronic-Waste:** Nineteen percent (18.8%) of households had a non-functional electronic or electrical equipment due for disposal.

Household waste management has both environmental and health implications on individuals and communities. Improper disposal of waste by households has been a key contributor to flooding in urban centres due to blockage of drainage channels and also leads to proliferation and breeding of disease-causing agents; vectors like mosquitoes and flies, rodents like rats and bacteria in the environment leading to disease outbreaks such as malaria, cholera, dysentery, typhoid among others. Waste has been highlighted as a key contributor to climate change and as a key emitter of methane gas generated through the decomposition of biodegradable waste.

14.1 Solid Waste

This section will cover aspects of solid waste management. Household waste management has both environmental and health implications on individuals and communities.

Household Solid Waste refers to the unwanted or discarded solid materials generated by residential activities. This type of waste includes a variety of items produced/generated in daily living, such as: Organic Waste, Recyclable Materials, Non-recyclable Waste, Bulky Waste and Hazardous Waste.

14.2 Categories of Solid Waste Disposal

The 2024 census collected information from households on the categories of solid waste disposal, which include proper and improper waste disposal.

Proper waste disposal methods include: local dump supervised by an urban authority and Waste vendor.

Improper waste disposal methods include: disposing in the garden, Burning, Pit, Local dump-unsupervised, river/sea/stream/pond, Bush and other methods.

The results show that, overall majority (92%) of the households (9.8 million) used improper methods of solid waste disposal. (Figure 14.1 and Table 14.1)

Figure 14.1: Distribution of Households by Categories of Solid Waste Disposal (Percentage)

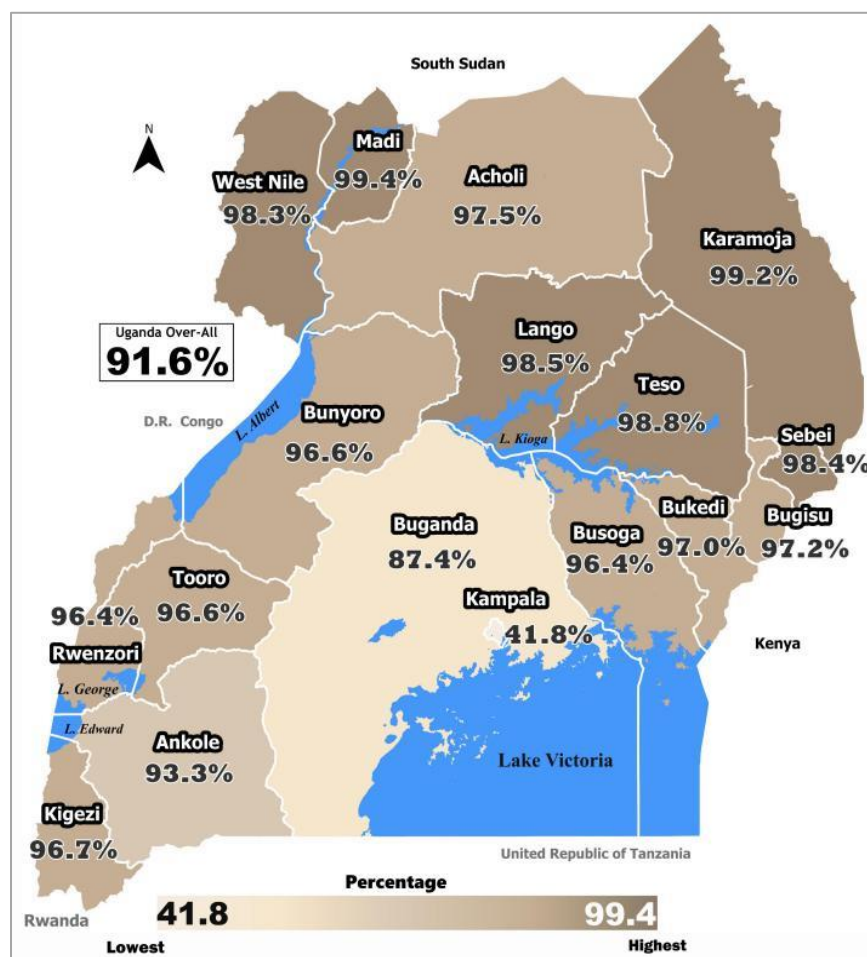

**Proper: local dump supervised by Urban Authority and waste vendor*

**Improper: Garden, Burning, Pit, Local dump-unsupervised, river/sea/stream/pond, Bush, other*

Improper waste disposal was higher among households in rural areas (98.3%) compared to urban areas (81.8%) (Table 14.1). Madi sub Region had the highest proportion of households with improper methods of waste disposal at 99.4 percent , while Kampala Capital City had the lowest (41.8%) (Figure 14.2).

Figure 14.2: Percentage Distribution of Households by Improper Solid Waste Disposal

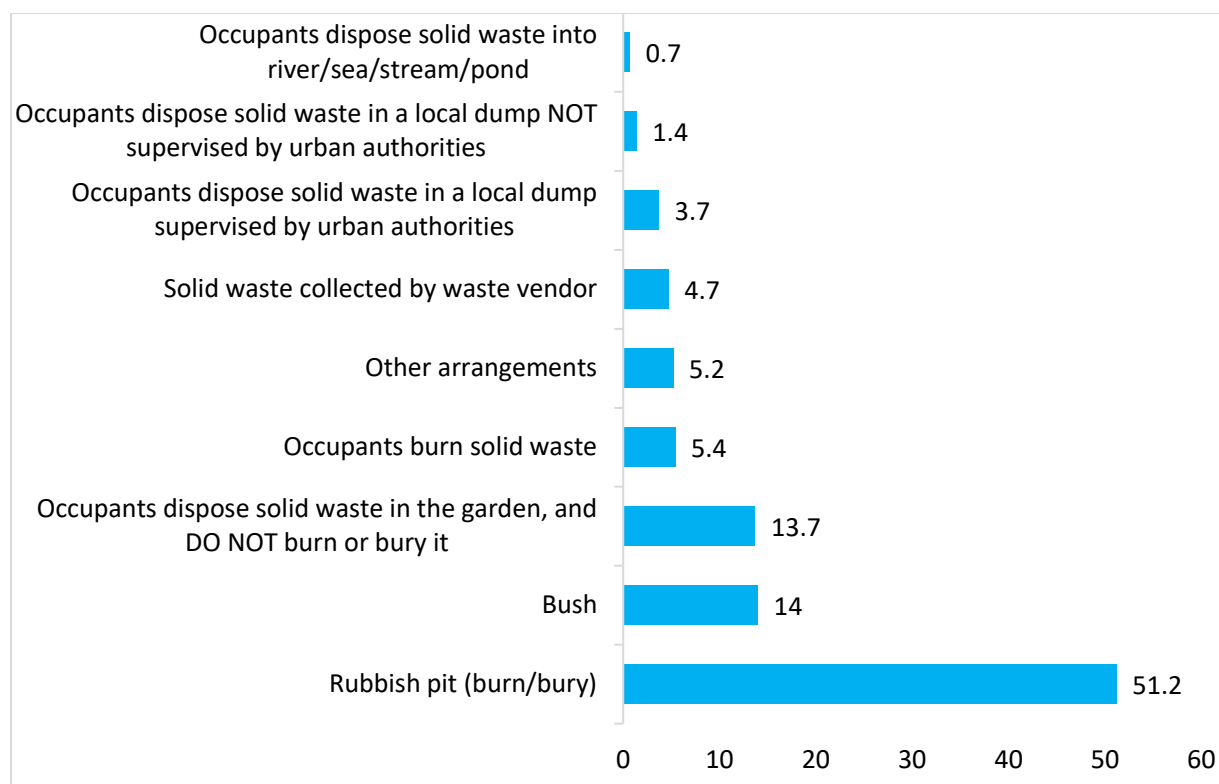

14.2.1 Most commonly used Methods of Solid Waste Disposal

Results presented in **Figure 14.3** show that more than half of the households (51.2%) dispose solid waste in the rubbish pit (burn/bury), while one percent dispose into river/sea/stream/pond or a local dump not supervised by urban authorities.

Disaggregation by sub Region shows that disposing by;

- More households in the rural areas reported the Rubbish pit (52.7%), Bush (18.2%) and Garden (16.0%) as the most commonly used method of solid waste disposal, compared to those in urban areas (49.1%, 7.9% and 10.3%).
- More households in the urban areas reported collection by waste vendor (10.4%), local dump supervised by urban authorities (7.7%) and burning (6.8%) as the most commonly used method of solid waste disposal, compared to those in rural areas (0.8%, 0.9% and 4.5%).
- Madi sub Region had the highest percentage of households (77.8%) whose most commonly used method of solid waste disposal was Rubbish pit, while Kampala Capital City had the least (23.3%). (**Table 14.2**)

Figure 14.3: Percentage Distribution of Household's Main Methods of Solid Waste Disposal

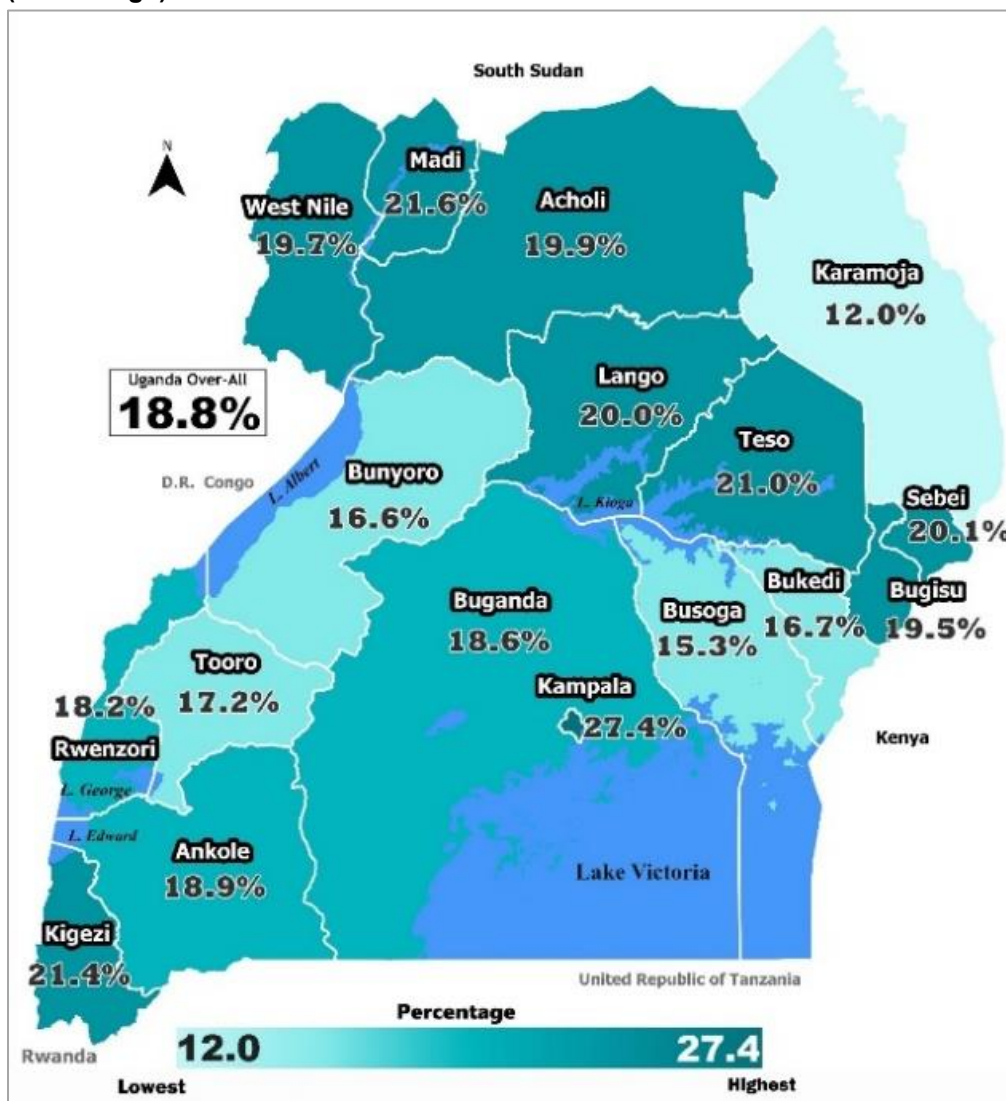

14.3 Electronic-Waste

During the census data collection, respondents were asked whether there was any household member that had a non-functional electronic or electrical appliance/device including mobile phones, batteries, television, computer/ laptop, refrigerator, radios, flat irons, electronic kitchen appliances. Subsequently, they were asked about the most commonly used method of electronic waste disposal.

Results show that 18.8 percent of the households had at least one household member with a non-functional electronic or electrical equipment. Possession of a non-functional electronic or electrical equipment by at least a member in the household was highest in Kampala Capital City (27.4%) and lowest in Karamoja sub Region at (12.0%) (Figure 14.4 and Table 14.3).

Figure 14.4: Households in Possession of Non-functional Electronic or Electrical Equipment by sub Region (Percentage)

Key Findings

- **Disability Prevalence**
 - Disability prevalence was 3.4 percent (1,289,513 persons) among the population aged 5 and above.
 - Disability prevalence was 3.4 percent (1,421,632 persons) among the population aged 2 and above.
 - Disability prevalence was 2.4 percent (460,805 persons) among children aged 2-17.
- **Albinism:** 78,876 persons aged 2 and above had Albinism.
- **Little persons:** 194, 271 persons aged 18 and above were little persons.
- **Multiple disability:** 478,462 persons aged 2 and above had multiple disability.

The NPHC 2024 used the recommended measure by the Principles and Recommendations of Population and Housing Censuses (Revision 3), the World Health Organization’s International Classification of Functioning, Disability, and Health 2001, and guidelines of Washington Group on Disability Statistics of 2022 and 2023 to define disability.

Accordingly, a person is defined as having a disability if they report having “a lot of difficulty” or “cannot do at all” in at least one of the six questions focusing on Vision; Hearing; Mobility; Cognition (Remembering); Self-care and Communication. The questions, therefore, provide basic necessary information on disability comparable at an international level. It is important to understand that the figures reported in this chapter are derived from the population in households only.

15.1 Prevalence of Disability

Persons With Disability aged 5 and above were 1,289,513, equivalent to a prevalence rate of 3.4 percent. Females had a higher prevalence (3.6%) than males (3.2%). (Figure 15.1 and Table 15.1)

Figure 15.1: Percentage of Persons aged 5 and above with a Disability by Sex

15.2 Disability Prevalence – 2 years and above

The Persons With Disability aged 2 and above were 1,421,632, equivalent to the prevalence rate of 3.4 percent. Females had a higher prevalence (3.5%) than males (3.2%). (Figure 15.2 and Table 15.1)

Figure 15.2 Percentage of Persons aged 2 and above with a Disability by Sex

15.3 Children With Disability

The Washington Group/UNICEF Child Functioning Difficulty classifies children with disability into age groups 2-4 years and 5-17 years. The NPHC 2024 revealed that there were 460,805 children aged 2-17 with disability, equivalent to a disability prevalence of 2.4 percent.

The number of children with disability aged 2-4 was 132,119, equivalent to a disability prevalence rate of 3.3 percent (**Figure 15.3**). The number of children with disability aged 5-17 was 328,686, equivalent to a disability prevalence rate of 2.1 percent (**Figure 15.4**).

Figure 15.3 Number of Children with a Disability aged 2-4 by Sex

Figure 15.4 Number of Children with a Disability aged 5-17 by Sex

15.4 Albinism and Little persons

The Revised National Policy of Persons with Disabilities in Uganda, 2023, includes Albinism and Little Persons as part of the categories of Disability. The policy includes forms of impairments including deaf and hard of hearing, blind and low vision, deaf and blind, and neurological disorders, among others.

Figure 15.5 Number of Persons aged 2 and above with Albinism

Findings show that there were 78,876 persons aged 2 and above with albinism (**Figure 15.5**). Of these, 10,291 had a disability (13.1%).

The Census 2024 defined a little person as a genetic or medical condition that usually results in an adult height of 147cm (4 feet and 10 inches) or shorter. The analysis on little persons focused on persons aged 18 years and above. Figure 15.6 shows that 194, 271 persons (0.9%) aged 18 and above were Little persons.

Figure 15.6 Number of Little Persons aged 18 and above

15.5 Forms of Impairments

The NPHC 2024 collected information on forms of impairments including deaf and hard of hearing, blind and low vision, deaf and blind, and neurological disorders. The information on the severe impairments highlighted in the revised disability policy can be derived from the six domains for disability measurement, based on the levels of severity for each domain, for instance those who could not hear at all are classified as deaf while those who had difficulty hearing are classified as persons with ‘hard of hearing’.

15.5.1 Deaf and Hard of Hearing

Deafness is a condition of total loss in Hearing. In the NPHC 2024, this was considered as “cannot do at all” for Hearing whereas hard of Hearing was considered as “a lot of difficulty”. The results show that 41,431 persons were deaf and 273,167 persons were hard of hearing. (**Figure 15.7**)

15.5.2 Blind and Low Vision

A person was considered “blind” or having “low vision” if he/she reported that they “cannot do at all” or had “a lot of difficulty” with Vision respectively. The results show that 28,843 persons were blind and 329,489 persons had low vision. (**Figure 15.7**)

15.5.3 Deaf-Blind

A person was considered “deaf-blind” if he/she reported that they “cannot do at all” for Hearing and Vision. The results show that 6,314 persons were deaf blind (Figure 15.7).

Figure 15.7: Number of Persons aged 5 and above with Selected Forms of Impairments

Figure 15.8 shows that 91,313 persons could not care for themselves at all, 72,984 persons could not communicate (speak) at all, 59,206 persons could not walk at all and 48,372 persons could not remember at all.

Figure 15.8: Number of Persons aged 5 and above with Selected Forms of Walking, remembering Self care or Speech Difficulty

15.6 Multiple Disability

Multiple disability

Persons who reported having at least two categories of disability, as defined in the PWD Act are considered having multiple disability. For instance this includes a person who is blind and cannot walk, the deaf-blind, among others.

Among persons aged 2 and above with disability, 478,462 had multiple disabilities while 437,819 persons aged 5 and above had multiple disabilities (**Figure 15.9, Figure 15.10 and Table 15.3**)

Figure 15.9: Persons aged 2 and above with Multiple Disabilities

Figure 15.10: Persons aged 5 and above with Multiple Disabilities

15.7 Disability Prevalence using six Questions and including Some Difficulty

The number of Persons With Disability aged 5 and above, based on the six questions and who reported having Some Difficulty; A lot of difficulty; or Cannot do at all were 5,153,649 persons, which represents a prevalence rate of 13.2%.The number of Persons With Disability aged 2 and above is 5,522,588, which represents a prevalence rate of 13.2% (**Figure 15.11 and Table 15.4**). This cannot be compared with 2014 findings.

Figure 15.11: Number of persons aged 2 and above with a disability by sex and age group, 2024

Note: Using the six questions and including Some Difficulty of the calculation of disability prevalence rate NPHC 2024 cannot be compared to NPHC2014

15.8 Disability Prevalence using Four questions and including “Some Difficulty”, 2014-2024

This section compares disability prevalence in Census 2024 with what was reported in Census 2014, using four functioning questions focusing on Vision; Hearing; Cognition (remembering) and Mobility, for persons who reported having **Some Difficulty**; **Alot of Difficulty**; or **Cannot do at all**. The findings (based on similar measurement used in the NPHC 2014) are presented in Figures 15.12 and 15.13.

Figure 15.12 shows that the number of persons aged 2 and above with a disability increased from 3,941,361 persons (equivalent to 12.4%) in 2014 to 4,936,835 (equivalent to 11.8%) in 2024.

Figure 15.12: Number of persons 2 years and above with disability by sex, 2014 – 2024

Persons with a disability aged 5 and above increased from 3,790,028 persons (equivalent 13.6%) in 2014 to 4,681,003 persons (equivalent to 12.4%) in 2024.

Figure 15.13: Number of persons aged 5 and above with a disability by sex and age group, 2014 – 2024

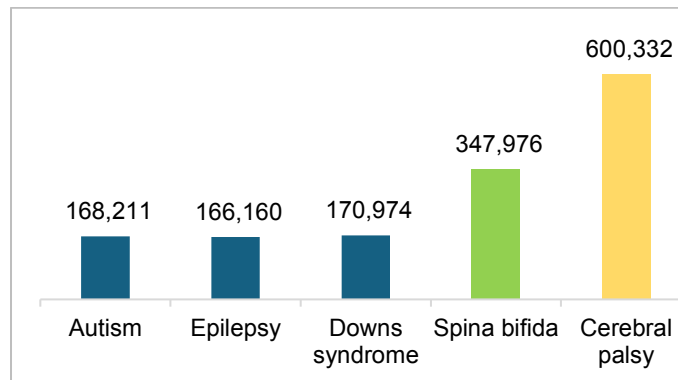

15.9 Neurological disorders

These are conditions that target how the nervous system (brain, spinal cord and nerves) functions. Information was collected on neurological conditions of household members, including autism, cerebral palsy, down syndrome, epilepsy and spina bifida (*International Classification of Diseases, 11th Revision*). The NPHC 2024 sought to understand how many persons aged 5 and above had any neurological condition.

- **Autism:** Those who reported to be with Autism 168,211 persons.
- **Cerebral palsy:** Those who reported to be with Cerebral palsy were 600,332 persons.
- **Downs syndrome:** Those who reported to be with Downs syndrome were 170,974 persons.
- **Epilepsy:** Those who reported to be with Epilepsy were 166,160 persons.
- **Spina bifida:** Those who reported to be with Spina bifida were 347,976 persons.

The most common neurological disorder was Cerebral Palsy (600,332 persons), while the least common neurological disorder was Epilepsy (166,160 persons) (**Figure 15.14**). Details for persons aged 2 and above are presented in **Table 15.5**.

Figure 15.14: Number of Persons aged 5 and above with Neurological Disorders

List of Tables

For more information on disability, see the following tables:

Key Findings

- **Children (0-17):** Half (49.9%) of the household population (22.2 million) were children aged 0-17; an increase from 18.9 million in 2014.
- **Birth Certification:** One in every ten (10.3%) of children under 5 years had full birth registration.
- **Orphanhood:** Thirteen percent (12.9%) of children were orphans who had lost either one parent or both.
- **Children not in Primary by Age 6:** Six in every ten (59.9%) children were not in their first year of Primary by age 6 with Karamoja sub Region having the highest percentage at 82.8.
- **Idle Children:** Nearly three out of every ten (27%) of children aged 14-17 were out of school and not working with Karamoja sub Region having the highest proportion (51%).

The Uganda constitution defines a child as any human being below the age of 18 years and this aligns with the definition by the United Nations Convention on the Rights of the Child (CRC) which considers anyone under the age of 18 as a child.

This section examines the distribution and share of children aged 0 to 17 years among the population, their birth registration, orphanhood; and living with their biological parents and the housing conditions in which they live. Data on children is required to monitor indicators of SDGs and other development programs.

The data is examined in respect of the children's age, Sex, sub Regions, and District/City.

16.1 Sex and Age of Children

The NPHC 2024 obtained information to offer an in-depth understanding into the number, distribution, and characteristics of children, which is critical for planning in education, health, and social services. Census data on children aged 0-17 gives a comprehensive understanding of this demographic group, focusing on age subgroups, regional and gender distribution, school enrolments, vulnerability, and housing conditions. This information is critical for policymakers to create and execute successful programs in education, healthcare, and social services, ensuring that the needs of this important part of society are satisfied. Of the 45.9 million persons in Uganda, 22.15 million were children aged 0-17.

16.1.1 Sex Distribution

There was a total of 22,152,538 children in 2024 . (Figure 16.1& Table 16.1).

Figure 16.1: Number of Children aged 0-17 by Sex

16.1.2 Children by Age Group

Figure 16.2 indicates that half (49.9%) of the household population comprised children: 14.9 percent were under the age of five, of which 9.3 percent were in 3-5 years age group, 19.3 percent in the primary school going age (6-12) group, and 12.6 percent in the secondary school going age (13-17). (see Figure 16.2 & Table 16.1).

Figure 16.2 Children by Age Group (Percentage)

16.1.3 Trends in distribution of children

Figure 16.3 indicates an increase in the number of children from 4.9 million in 1969 to 22.2 million in 2024.

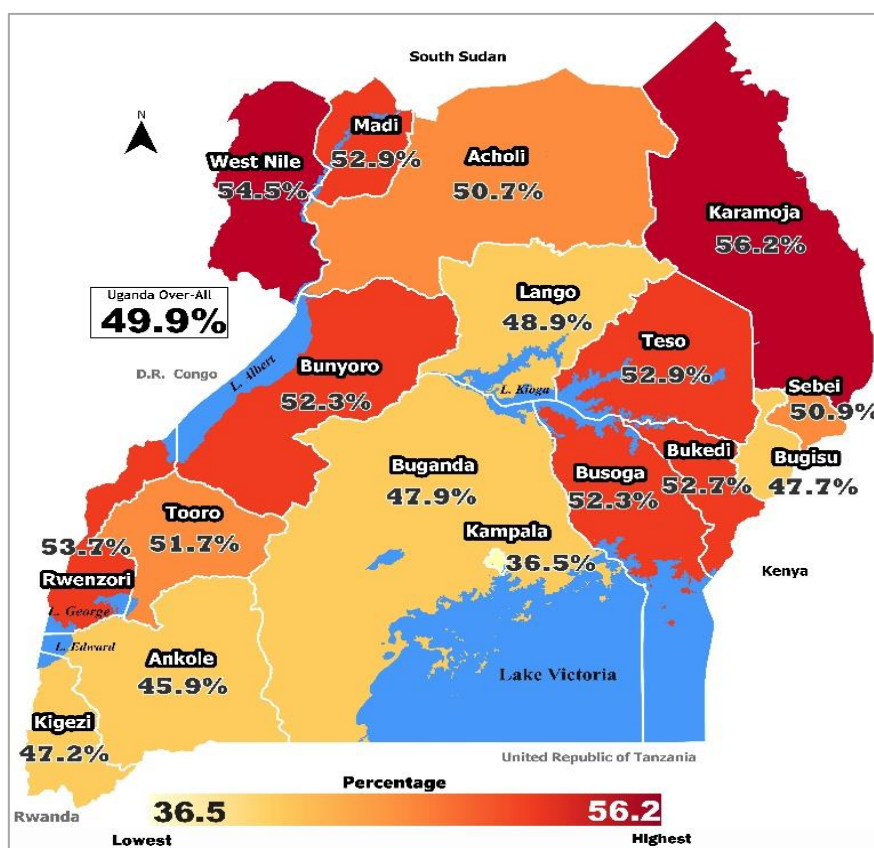

Figure 16.3 Number of Children (million), 1969- 2024

16.1.4 Children by sub Region

Figure 16.4 shows that Karamoja sub Region had the highest proportion of children (56.2%), while Kampala Capital City (36.5%) had the least. (Table 16.2).

Figure 16.4 Proportion of Children (0-17) within sub Region

16.2 Birth Certification of Children

In Uganda, birth registration and certification are governed by the Registration of Persons Act, 2015, which provides the legal framework for registering births, deaths, and other vital events. The registering of births and issuing birth certificate is coordinated by the National Identification and Registration Authority (NIRA) putting emphasis on registering births within 90 days from the date of birth. The possession of a birth certificate is the earliest formal recognition of a child's existence and citizenship of a country. The long birth certificate indicates that the child's birth has been officially recorded in the civil registry while short birth certificates and notification are process of attaining the children's complete birth registration. Birth certification is a critical legal document for children, as it serves several important functions that impact their rights, access to services, and future opportunities and these include: child's nationality, school enrollment and access to health services.

- Registered children are those who have obtained official long birth certificates
- Non-registered children include those who have received a birth notification from their place of birth or Village Health Teams (VHT), as well as those who have not received any notification at all.

Figure 16.5 shows that 9.8 percent of the children under one year and 10.3 percent under five years had their births registered, indicating they acquired long birth certificates.

Table 16.4 indicates that Kampala Capital City (15.4%) had the highest proportion of children under one year registered births, while Teso sub Region had the least (5.7%).

Figure 16.5: Percentage of Children under One year and under 5 years by Birth Registration Status

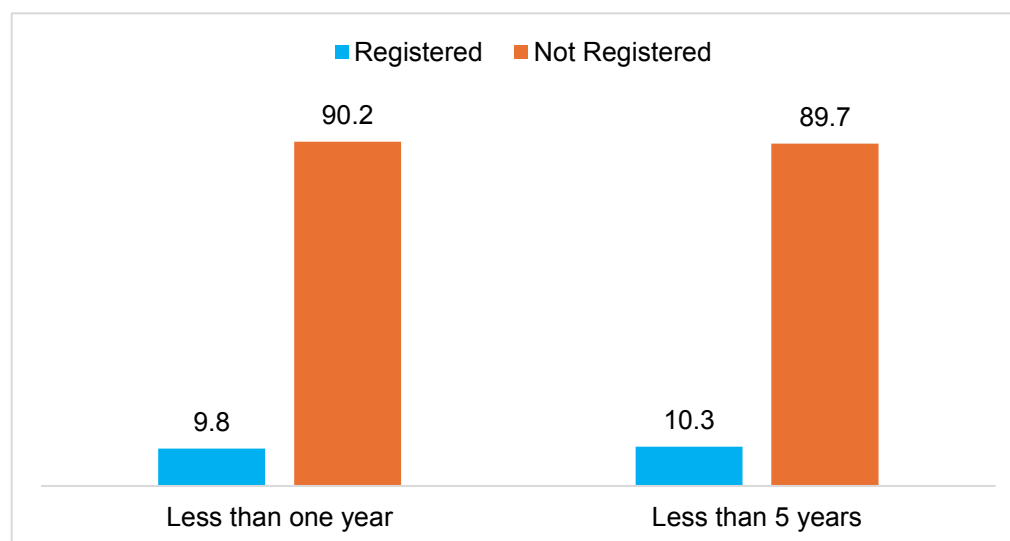

Figure 16.6: Percentage of Birth Registration for Under 5 Children by sub Region

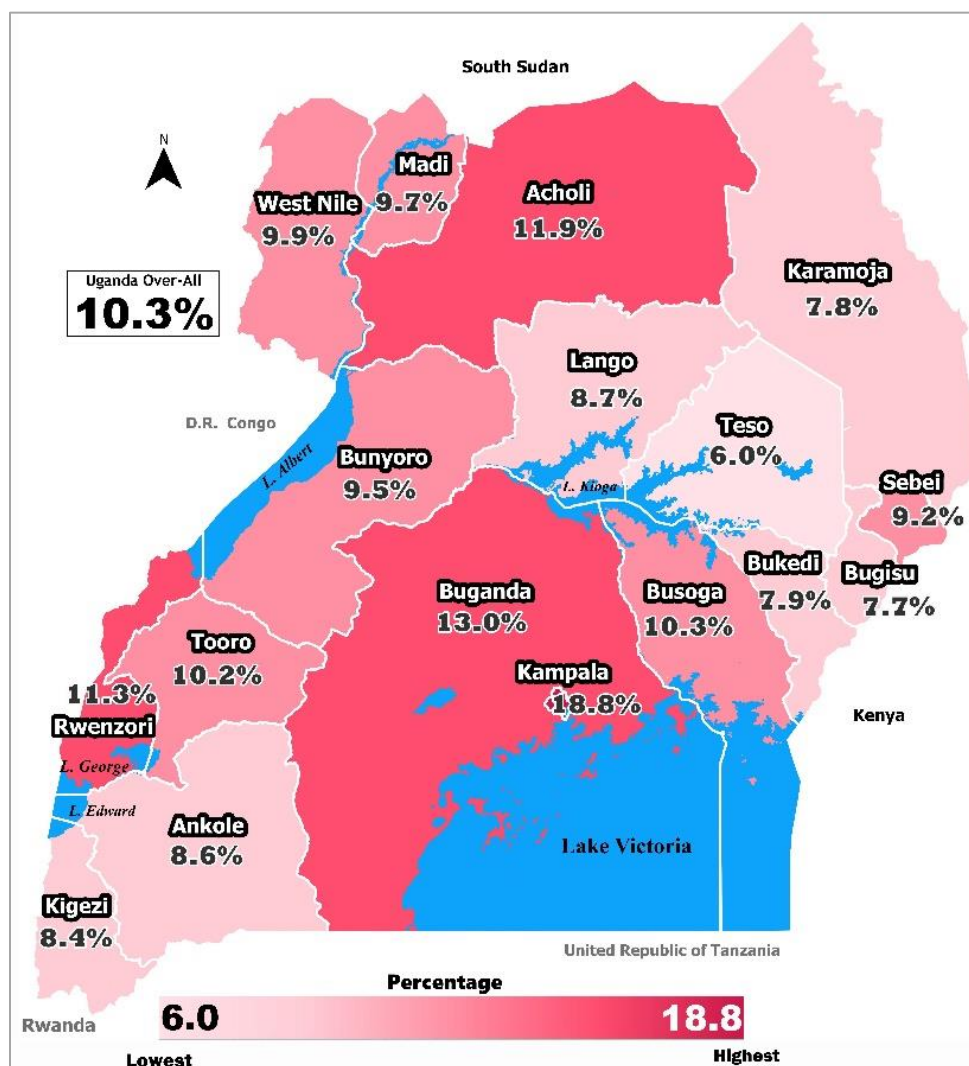

Figure 16.6 indicates that Kampala Capital City (18.8%) had the highest proportion of registered births, while Teso sub Region had the least (6.0%) (Table 16.5).

16.3 Orphaned Children

Orphanhood is defined as a child under the age of 18 who has lost one or both parents. A Maternal Orphan as a child who has lost their mother but whose father is still alive; A Paternal Orphan as a child who has lost their father but whose mother is still alive; Complete Orphan is a child who has lost both parents (mother and father).

Data on parental survival was collected in the census to derive orphanhood indicators to guide policymakers make choices about child welfare, social support systems, and the needs of vulnerable groups. This information will be used to design interventions for orphans, notably in education, healthcare, and other social protection mechanisms.

The results in **Figure 16.7** indicate that 13.0 percent of children were orphaned. Four percent (4.2%) of children were complete orphans (both their parents were dead).

Madi sub Region (20.1%) had the highest percentage of orphaned children, while Teso had the least (9.5%) (**Figure 16.8 and Table 16.6**).

Figure 16.7: Orphaned Children (Percentage)

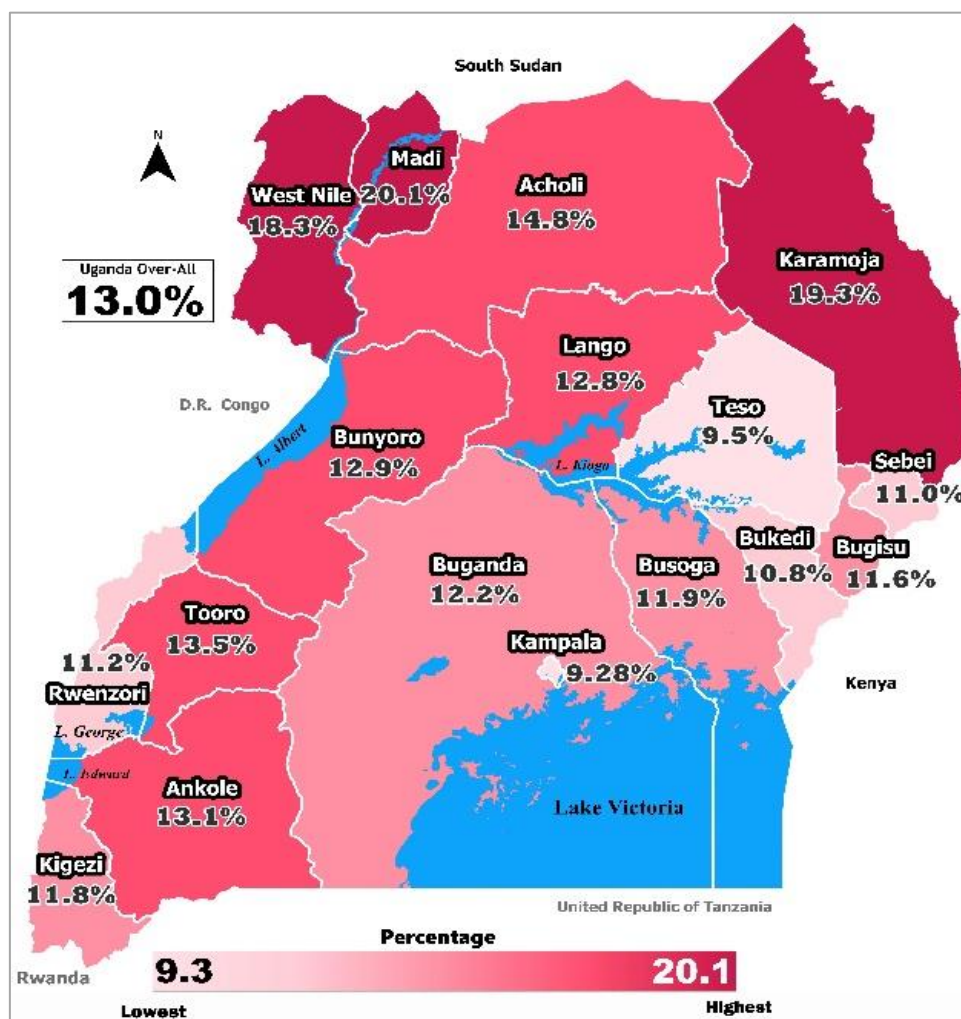

Figure 16.8: Percentage of Orphans by sub Region

16.4 Child Marriages

The Children's Act as amended 2016 defines child marriage as any union whether formal or informal involving any person below the age of 18 years for the purpose of living as husband and wife.

Seven percent of children were married/cohabiting. These comprised more females (7.7%) than males (5.6%).

Buganda sub Region had the highest (100,190) number of children who were married, while Madi sub Region had the least at 5,770 (Figure 16.10).

Figure 16.9 Children aged 10-17 who were Married/Cohabiting (Percentage)

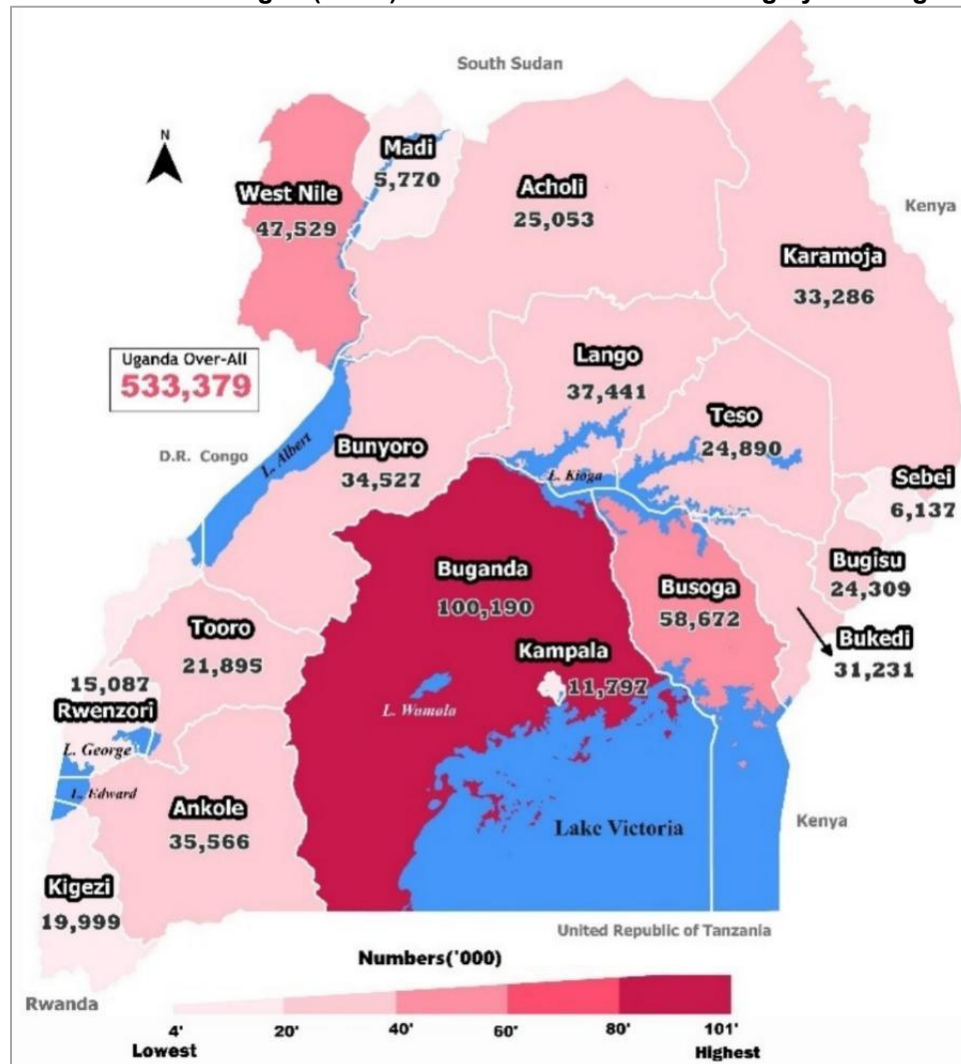

Figure 16.10 Number of Children aged (10-17) who were Married/Cohabiting by sub Regions

16.5 Children by Schooling Status

The Children (Amendment) Act 2016 (59): emphasizes the right of every child to education and places responsibilities on parents and the state to ensure children attend school and receive proper care and guidance.

The NPHC 2024 collected information on formal current school attendance and highest grade completed for all persons aged 3 years and over.

Figure 16.11 Children not in Primary One by Age 6 (Percentage)

Figure 16.11 shows that 59.9 percent of children were not in their first year of primary school by age six.

There were more males (62.0%) compared to females (58%) who were not in Primary One by age 6,

The results further shows that they were more children in rural areas (62.8%) not in Primary One by age , compared in urban areas (53.9%).

Figure 16.12 Proportion of Children of Primary School going age (6-12 years) that were out of school

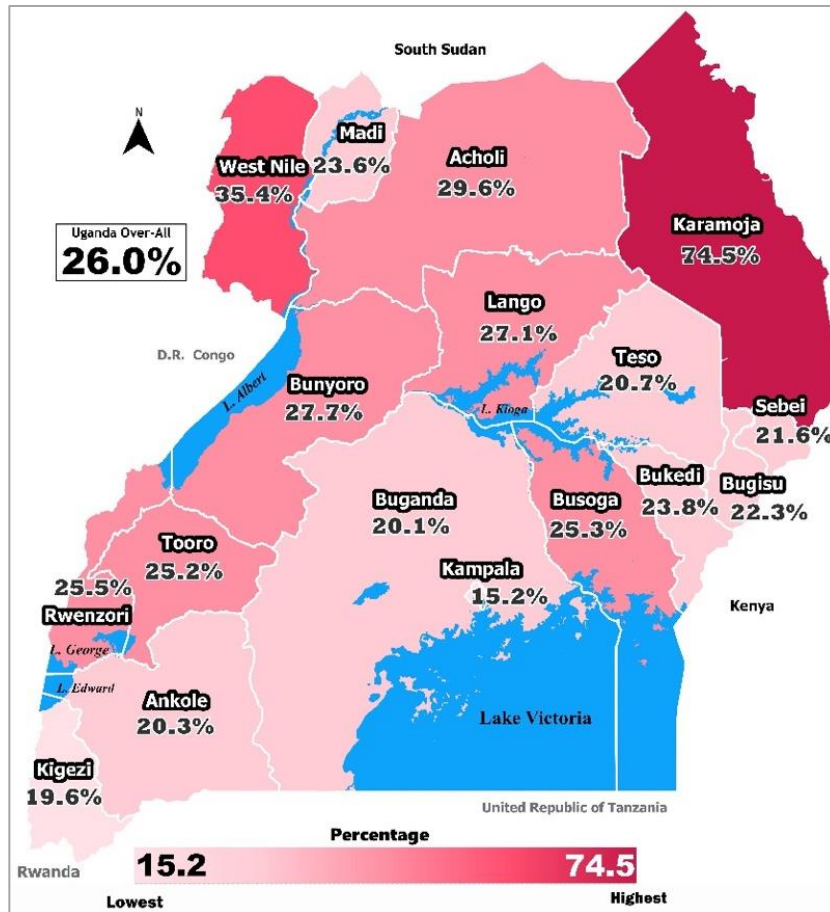

Figure 16.12 shows that 26.0 percent of children aged 6 to 12 were out of school.

Classification by rural-urban shows that (28.4%) of the children in rural areas were out of school compared to (21.2%) of those in urban areas.

Figure 16.13 shows that Karamoja sub Region had the highest proportion (74.5%) of children aged 6-12 who were out of school, while Kampala Capital City had the least (15.2%) (Table 16.3).

Figure 16.13 Proportion of Primary School-age Children (6-12 years) out of School by sub Region

Findings reveal that 34.2 percent of children aged 13-17 were out of school with higher percentages for females (34.5%) compared to that of males (33.8%) and children living in rural areas (35.8%) compared to those living in urban areas (31.3%) (Figure 16.14).

Figure 16.14 Percentage of Secondary School going age (13-17 years) that were out of School

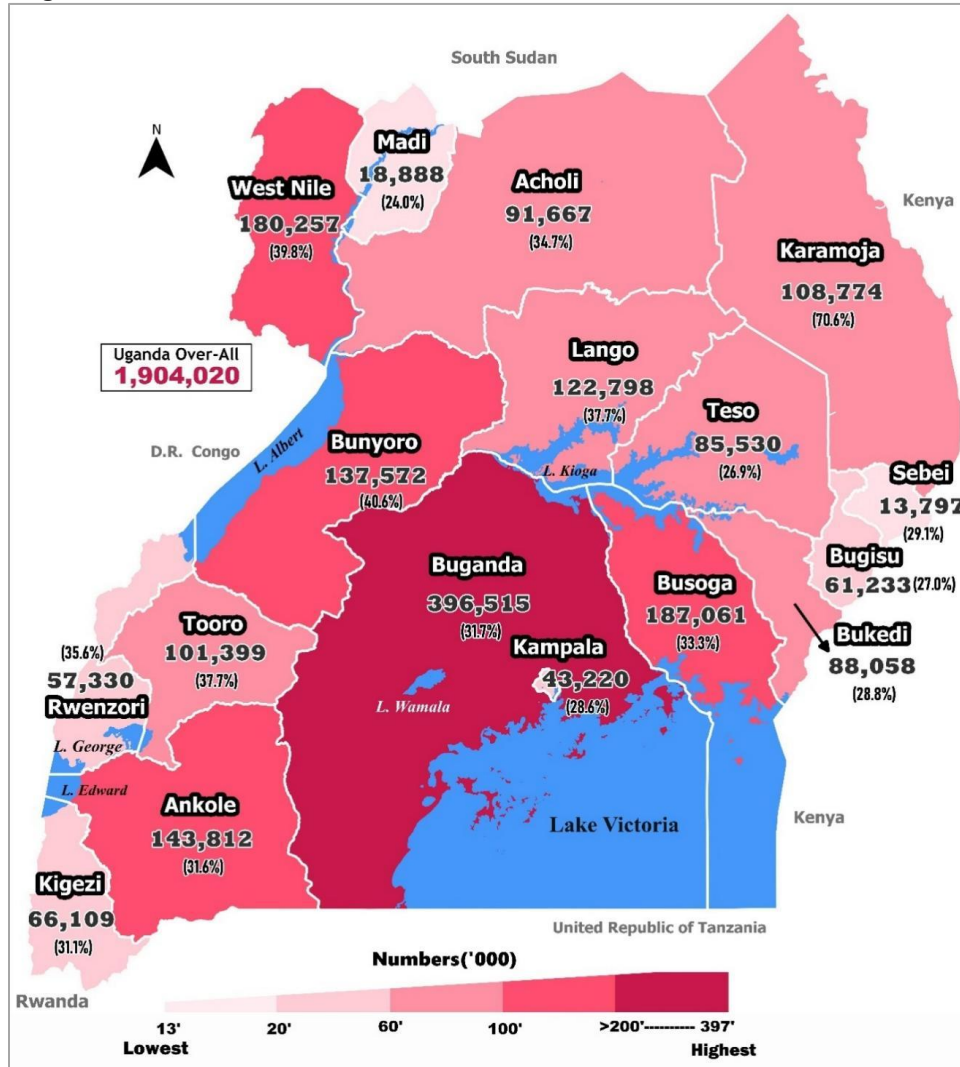

Figure 16.15 shows that Karamoja sub Region had the highest percentage (70.6%) of children aged 13-17 who were out of school, while Madi sub Region had the lowest (24.0%).

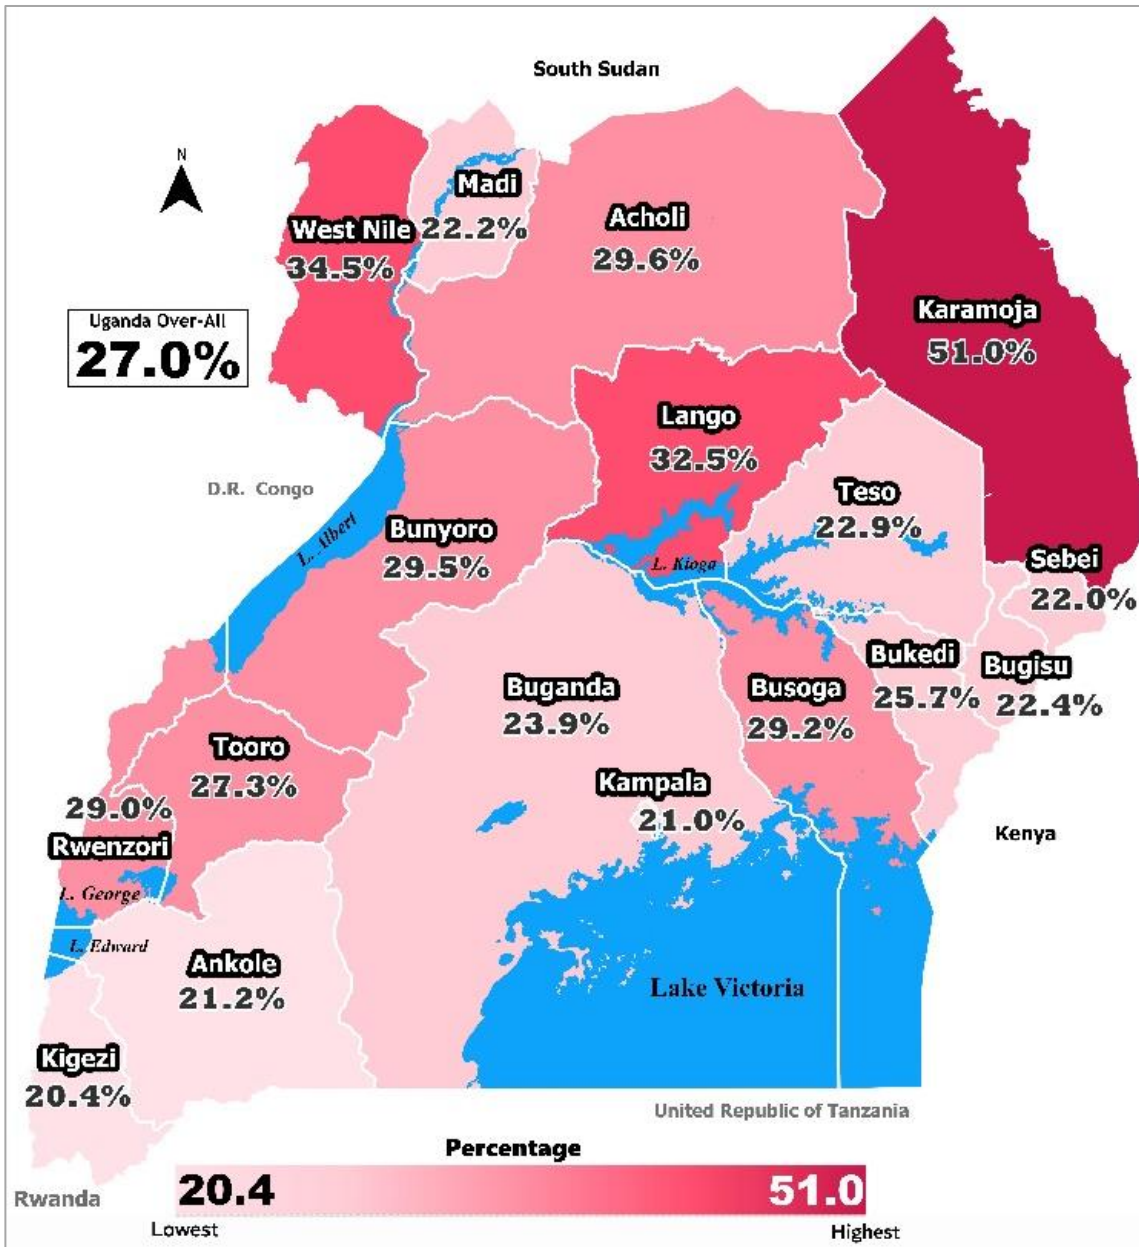

Figure 16.15 Number of Secondary School going age (13-17 years) that were out of school by sub Region

16.6 Idle Children

"Idle children" refers to children aged 14-17 who are not in school or actively participating in an economic activity. Figure 16.16 shows that 27.0 percent of children aged 14-17 were out of school and not in employment. Karamoja sub Region had the highest percentage (51.0%) of children who were out of school and not in employment, while Kigezi had the least (20.4%). (Table 16.7).

Figure 16.16 Proportion of Idle Children (14-17) by sub Region

16.7 Living Conditions of Children

Figure 16.16 shows that 47.8 percent of children were living in households where the nearest safe water source was less than half a kilometer away. Kampala Capital City had the highest percentage (82.7%) of children living in households where the nearest water source was less than half a kilometer away, while Karamoja sub Region had the least (30.5%) (Figure 16.17 & Table 16.8).

Figure 16.17 Percentage of Children living in Households within 1/2km from Safe Water Source for Drinking

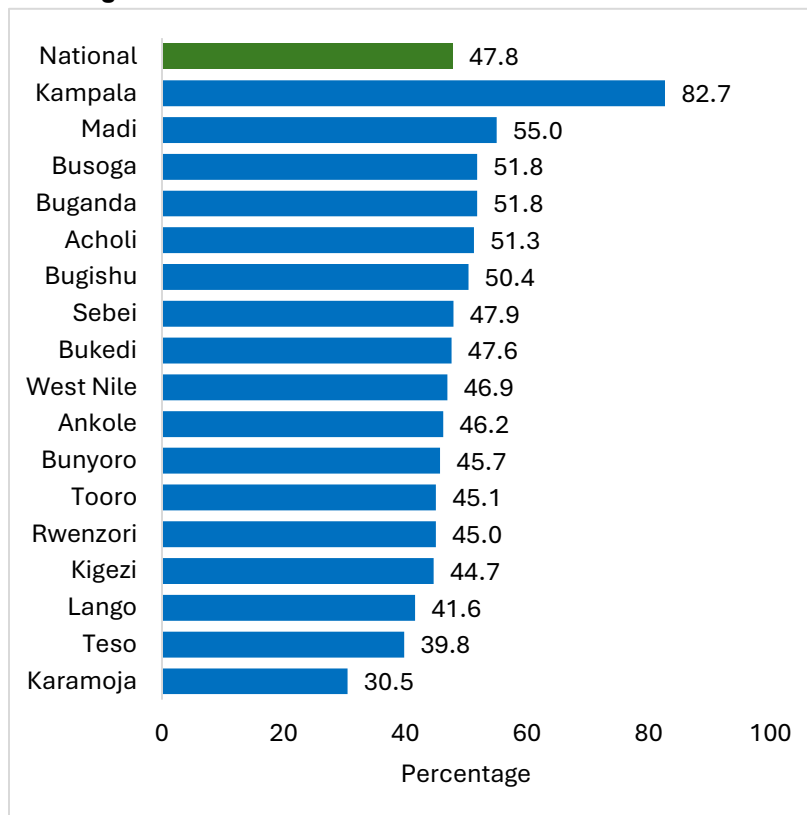

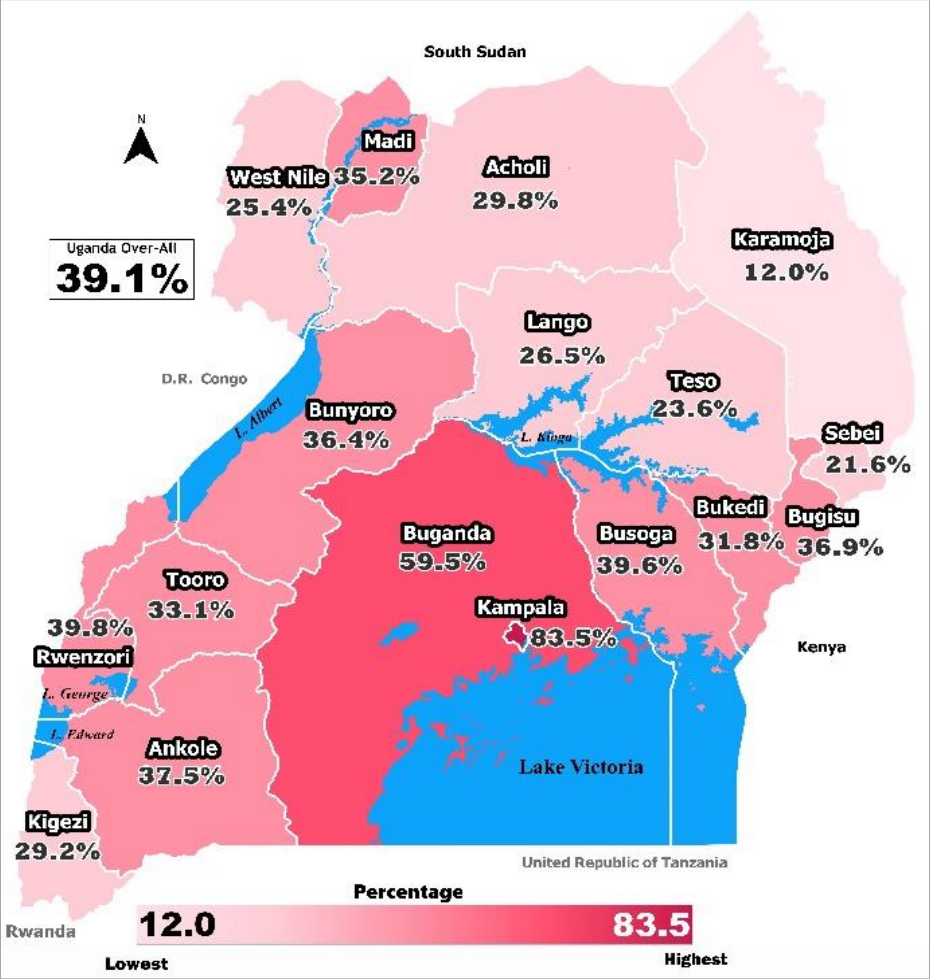

Figure 16.18 shows that thirty nine percent (39.1%) of children were living in households with improved toilet facilities, such as flush toilets, pit latrines with slabs, and ventilated improved pit (VIP) latrines, **without** sharing these facilities with other households.

Kampala Capital City had the highest percentage (83.5%) of children living in households with improved toilet facilities, while Karamoja sub Region had the least (12.0%) (**Table 16.8**).

Figure 16.18: Percentage of Children living in households with improved sanitation

Key Findings

- **Youth Population (15-24 years):** 9,751,311 persons (21.2%) of the total population.
- **Youth Population (18-30 years):** 10,769,151 persons (23.5%) of the total population.
- **Adolescent population (10-19 years):** 11,404,639 persons (24.8%) of the total population.
- **Literacy rate:** 82.8 percent among youth (15-24 years); 81.6 percent among youth (18-30 years). The Literacy rate among adolescents was 76.0 percent.
- **Household headship:** The share of household headship among youth aged 15-24 was 12.3 percent; and 29.1% among youth 18-30 years and three percent among Adolescents.
- **Beneficiaries of Selected Government Programmes:** One in ten (9.9%) youth (18-30 years) had benefitted from NAADs programme, while less than one percent of youth had benefitted from Emyooga (0.1%), OWC (0.3%) and YLP (0.4%) programmes.

The well-being of adolescents and youth is critical if the country is to harness the demographic dividend and remain key players in social-economic transformation. The enormous contribution of the adolescents and youth towards social economic transformation can be realized when their rights are protected and investments made in their education, employment, health, empowerment and civil participation. For statistical purposes, the United Nations defines “adolescents” as individuals in the 10–19-year age group and “youth” as the 15-24-year age group, whereas Uganda defines the youth as a person aged between 18-30 years (National Youth Council Act, 2015).

17.1 Proportion of Adolescent and Youth Population to the Total Population

Adolescents comprised 24.8 percent of the population while the youth (15-24 years) were 21.2%. Based on the national definition (18-30 years) 23.5 percent of the population were youths (**Figure 17.1**). Disaggregation by Sex shows that adolescents comprised more males (25.9%) compared to females (23.9%), while the youth there are more females than males (**Table 17.1A**). By Sub Region, Madi Sub Region had the highest percentage (28.5%) of adolescents, while Kampala Capital City had the least (20.3%). Madi also had the highest percentage (24.5%) of the population 15-24 years. On the other hand Kampala Capital City had the highest population (32.7%) of 18-30 years, while Kigezi had the least (20.2%) (**Figure 17.2 ; Figure 17.3; Table 17.1A**). Table 17.1B provides share of adolescents and youth to household population.

Figure 17.1: Percentage of the Adolescents and Youth to the total population, 1991–2024

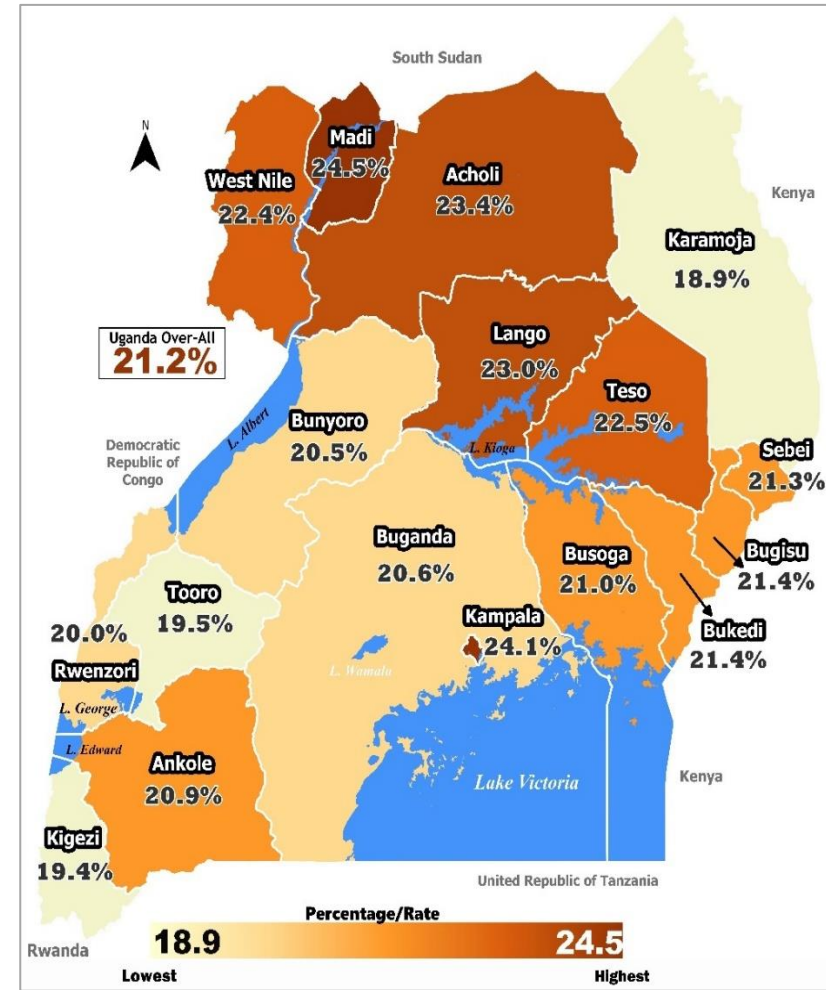

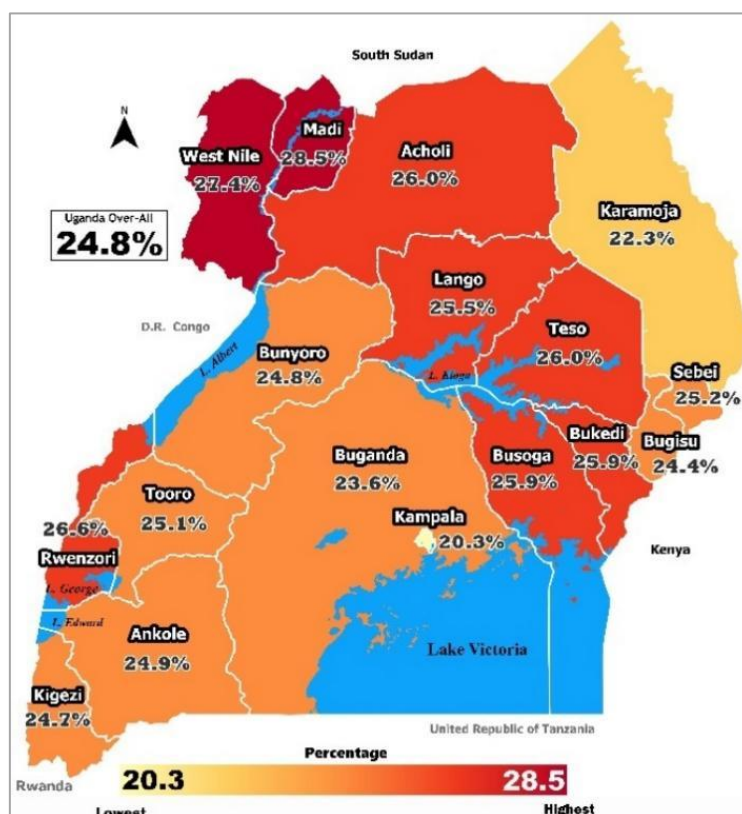

Figure 17.3: Percentage of Adolescents (10-19 years) to the Total Population

17.2 Education and Literacy Characteristics of Adolescents and Youth

Education imparts essential skills required for an individual’s personal and social growth. Through education, adolescents and youth become economically independent which is pertinent for socio-economic growth. Furthermore, adolescents and youth are able to adapt to newer techniques of production, increase their employability potential, among others. The Government of Uganda introduced the Universal Primary Education (UPE) in 1997 and Universal Secondary Education (USE) in 2007 to ensure that all children of school going age (especially those from poor backgrounds) are provided with free primary and secondary education (MoES, 2013).

17.2.1 Status of School Attendance of Adolescents and Youth

Figure 17.4 show that 64.4 percent of the adolescents were currently attending school, 21.2 percent attended school in the past and 14.4 percent had never attended school.

Forty eight percent of the population aged 15-24 years and 69 percent of the population aged 18-30 years attended school in the past. Eighteen percent of the population aged 15-24 years had never attended school and 34.2 percent were currently attending school (Figure 17.4, Table 17.4A – 17.4C).

Figure 17.4: Percentage of Adolescents and Youth by School Attendance Status

17.2.2 Education attainment of Adolescents and Youth

Figure 17.5 shows the education attainment of adolescents and youth. Overall, 18.6 percent of population aged 15-24 year, 17.6 percent of the population 18-30 and 15.4 percent of adolescents had no formal education.

Majority of the adolescents (61.1%) had attained some primary education, while less than one percent had attained post secondary education (0.1%). The highest proportion (32.2%) of youth (15-24 years) had attained some primary education, while the least proportion (2.2%) had attained post secondary education (Figure 17.5)

Karamoja sub Region had the highest percentage (68.3%) of the youth (15-24) and adolescents (66.5%) with no formal education, while Teso sub region had the lowest percentage of 12.8 percent (Table 17.3A, 17.3B and Table 17.3C).

Figure 17:5 Percentage of Youth and Adolescents by Level of Education Attainment

17.2.3 Literacy Rate of Youth and Adolescents

Overall, nine in every ten youth regardless of the definition were literate. The literacy rate among adolescents was 76.0 percent. Among the adolescents, the literacy rate was higher for females (77.6%) compared to the males (73.3%) (Figure 17.6).

Disaggregation by Sub Region shows that literacy among youth and adolescents was highest in Kampala Capital City (95% and 94.2%) and lowest in Karamoja sub region. (Figure 17.7, Figure 17.8A-B, and Table 17.5).

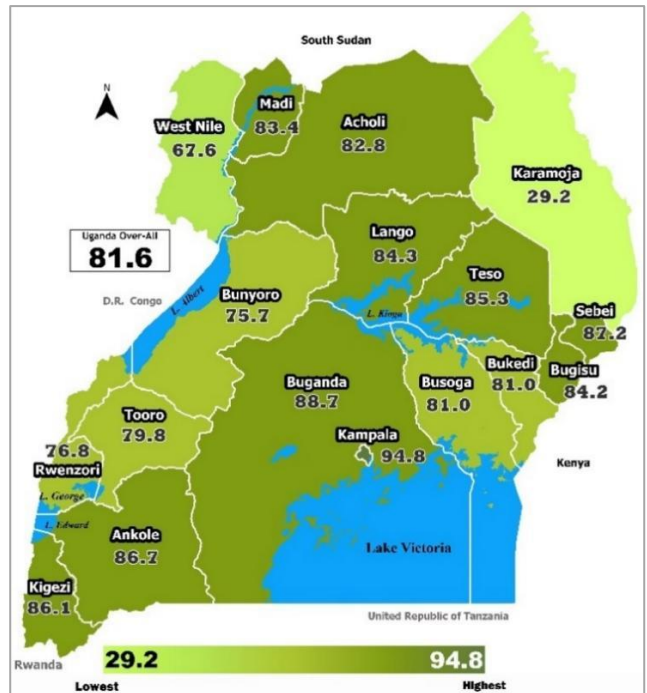

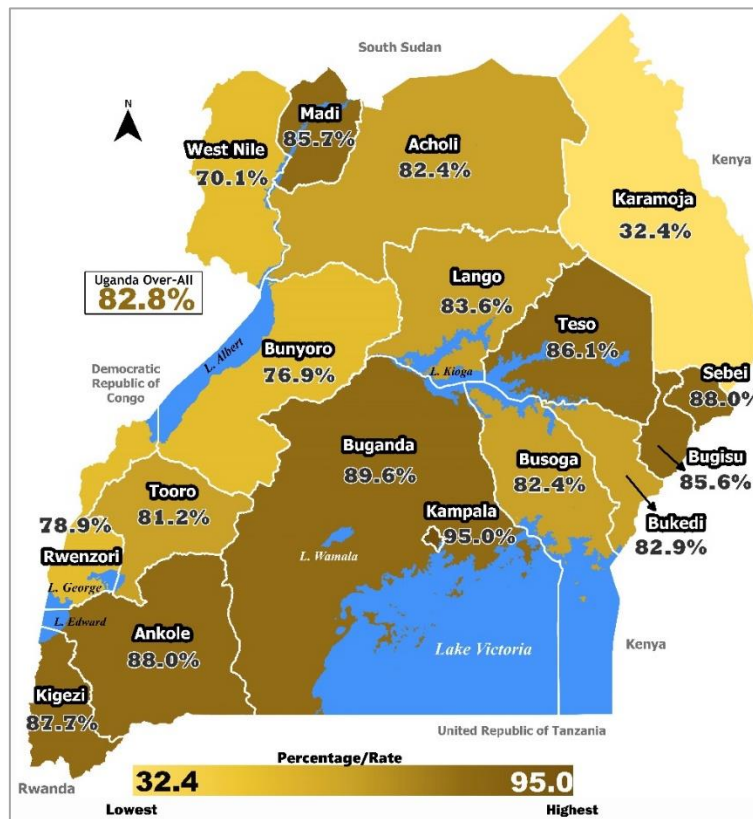

Figure 17.8B: Youth (15-24 years) Literacy Rate by sub Region

17.3 Household Characteristics

17.3.1 Household Headship among the Adolescents and the Youth

The results in Figure 17.9 indicate that the share of household headship was 12.3 percent and 29.1 percent among youth aged 15-24 years and 18-30 years respectively. Three percent of the adolescents were household heads. Among the 18-30 years youth household heads, there were more male headed households (31.0%) than the females (25.3%). The female adolescent household heads comprised of 3.0% percent compared to 2.3% of their males counterparts (**Figure 17.9 and Table 17.2**).

Results by sub region show that Kampala Capital City had the highest percentage of youth household heads by any definition of the youth (17.4% for 15-24 years and 40.3% for 18-30 years), while Kigezi sub region had the least (7.2% for 15-24 years and for 18-30 years 20.4%). Bugisu sub Region had the highest percentage (3.6%) of adolescent household heads, while Sebei sub Region had the least (1.2%) (**Table 17.2**).

Figure 17.9: Households headed by Youth and Adolescents (Percentage)

17.3.2 Average Household Size of Households Headed by the Adolescents and the Youth

On average, households headed by the youth 15-24 years had two members while those aged 18-30 years had three members. The adolescents headed households had two members. There were no notable differences in household sizes for both adolescents and youth by Sex of the household head (**Figure 17.10**).

Madi sub Region had the highest average household size among the youth headed households by any definition of the youth (4 members).

In adolescent-headed households, West Nile, Madi, and Karamoja sub Regions had a higher average household size (3 members) than all other sub Regions (1 member) (**Table 17.6**).

Figure 17.10: Average Household Size of the Households Headed by the Adolescents and the Youth

17.4 Youth beneficiaries of Selected Government Programmes

In order to address the issue of youth unemployment, the government has set up various interventions some of which are targeted towards the young people such as Youth Livelihood Program, Emyooga, and National Agricultural Advisory Services. The NPHC 2024 collected information on all persons aged 18 and above who had benefitted from selected government programmes in the last 12 months preceding the Census. This sub section therefore focuses on the youth aged 18-30 years because the programmes highlighted target this age group.

The proportion of youth who reported that they benefitted from selected Government programmes in the last 12 months preceding the Census are presented **Figure 17.11**.

One in ten (9.9%) youth had benefitted from NAADs programme, while less than one percent of youth had benefitted from Emyooga (0.1%), Operation Wealth Creation (0.3%) and Youth Livelihood Programme (0.4%) programmes. (**Figure 17.12**).

More females and youth from the rural areas (10.8% each) benefitted from the NAADs programme, compared to males and youth from the urban areas (8.5% each). More literate youth (10.6%) benefitted from the NAADS programme, compared to the illiterate (6.5%).

Acholi sub Region had the highest percentage (20.7%) of youth beneficiaries of the NAADs programme, while Sebei sub region had the least (4.4%) (**Table 17.7**).

*** YLP (Youth Livelihood Programme), OWC (Operation Wealth Creation), NAADS (National Agricultural Advisory Services)

Key Findings

- **Population of older persons:** Older persons aged 60 years and above constitute 5.0 percent of the total population.
- **Literacy rate:** 45.9 percent of the older persons were literate
- **Average household size of households headed by older persons.** On average 4.6 members were in a household headed by an older person.
- **Older persons' living arrangements:** 13.3 percent of the older persons were living in single-person households

The national policy for older persons defines older persons as those persons aged 60 years and above (MoGLSD, 2009). Globally, the growing population of older people is considered a potential resource for families, communities, the economy and society as a whole. There is a need to furnish data on older persons to facilitate evidence-based policy development and planning in order to monitor the national and global development agenda. The World Health Organisation (WHO) and National Policy for Older Persons recognizes that as people age, they should enjoy a dignified life and active participation in economic, social, cultural and political life in their communities. There is therefore need to know where the older persons are and their access to services.

The analysis in this chapters considered; older persons (60+ years) as per national policy of older persons, International standard (65+ years) for comparison with other countries and those aged 80+ year who benefit from the Social Assistance Grant for Empowerment (SAGE) in Uganda.

18.1 Population size and distribution of older persons

18.1.1 Sex distribution of Older Persons

The proportion of older persons aged 60+ to the total population was five percent with more older female (5.5%) than older male (4.4%) as shown in **Figure 18.1**.

Figure 18.2A-C presents Sub Regional differentials in share of older persons aged 60+, 65+ and 80+. Buganda had the highest number (509,603 persons) of older persons aged 60+, while Sebei had the least number at 17,535 older persons (**Table 18.1A**). **Table 18.1B** provides details on share of Older persons to household population.

Figure 18. 1: Older Persons by Sex and Age Group (Percentage)

Figure 18. 2A: Number of Older Persons (60+ years) by sub Region

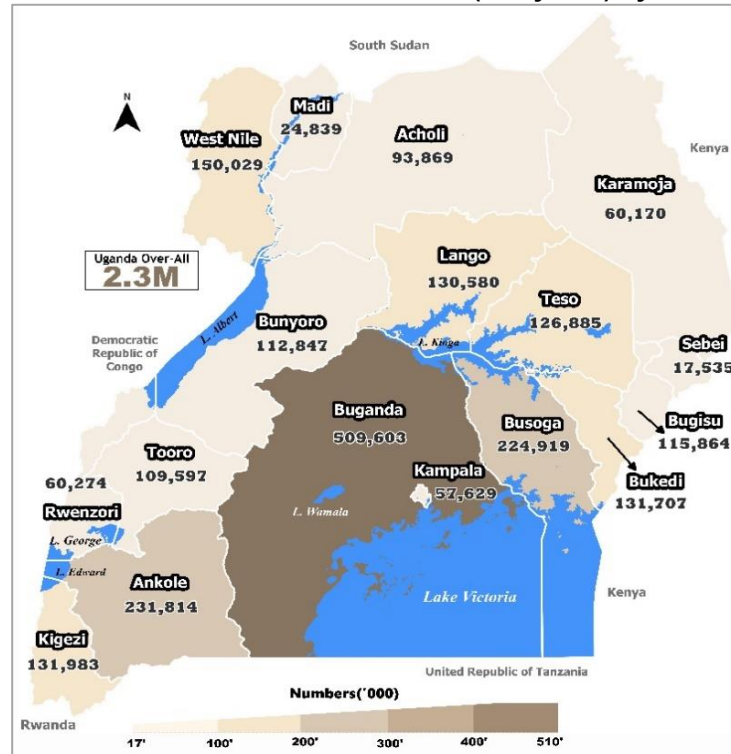

Figure 18. 2B: Number of Older Persons (80+ years) by sub Region

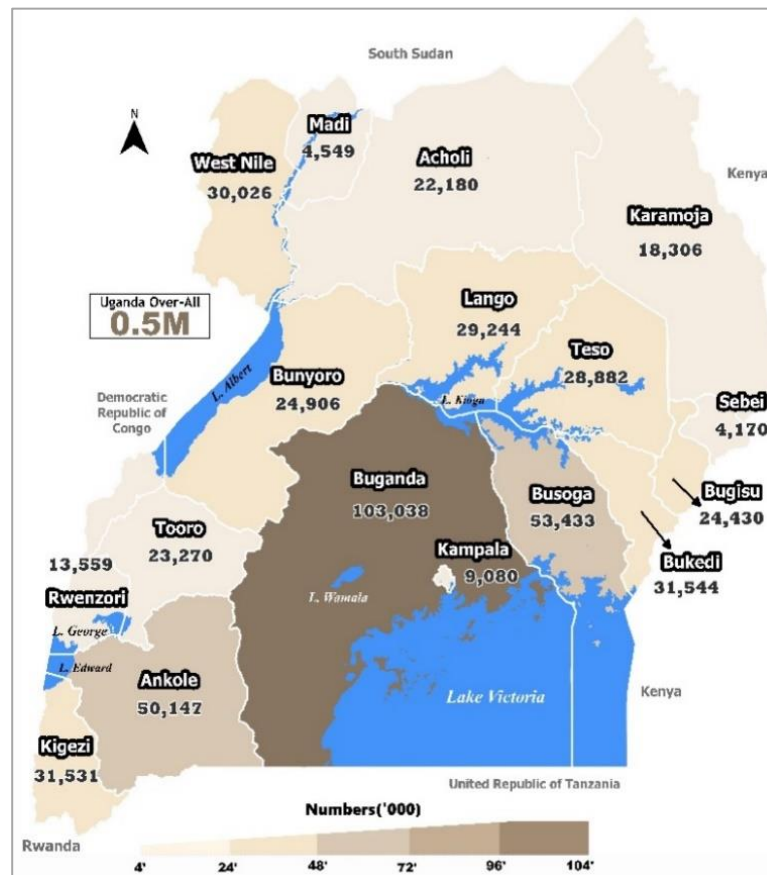

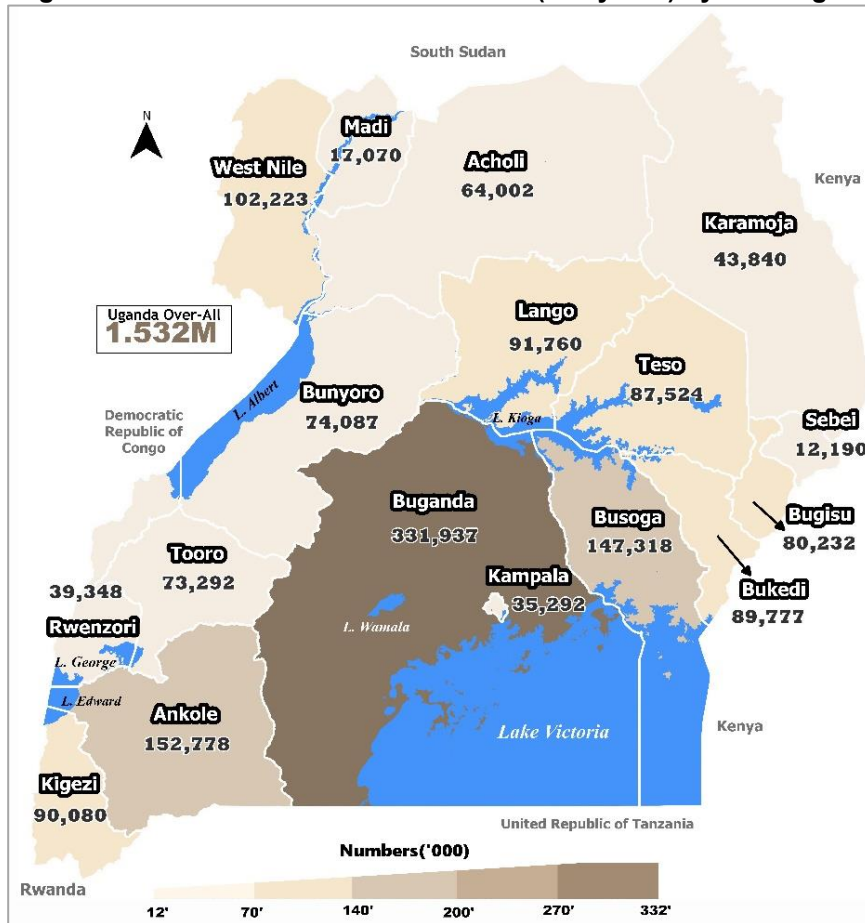

Figure 18. 2C: Number of Older Persons (65+ years) by sub Region

18.1.2 Age group of Older Persons

Figure 18.3 indicates that most older persons were within the age group of 60-64 years. The proportion generally reduces with an increase in age.

Figure 18. 3: Older Persons by Age group and Sex (Percentage)

18.1.3 Proportion of Older Persons in 2014 and 2024

The NPHC 2024 shows that there was an increase in the proportion of older persons from four percent in 2014 to five percent in 2024 (**Figure 18.4**).

Figure 18. 4: Older Persons (60 years and above), 2014-2024

18.2 Literacy

The literacy rate of older persons aged 60 and above was 45.9 percent. The literacy rate was higher among the males (62.6%) compared to females at 34.3 percent (Figure 18.5; Table 18.2).

Figure 18. 5: Literacy Rate among Older Persons by Sex

Figure 18. 6A: Literacy Rates of the Older Persons (60 years and above) by sub Region

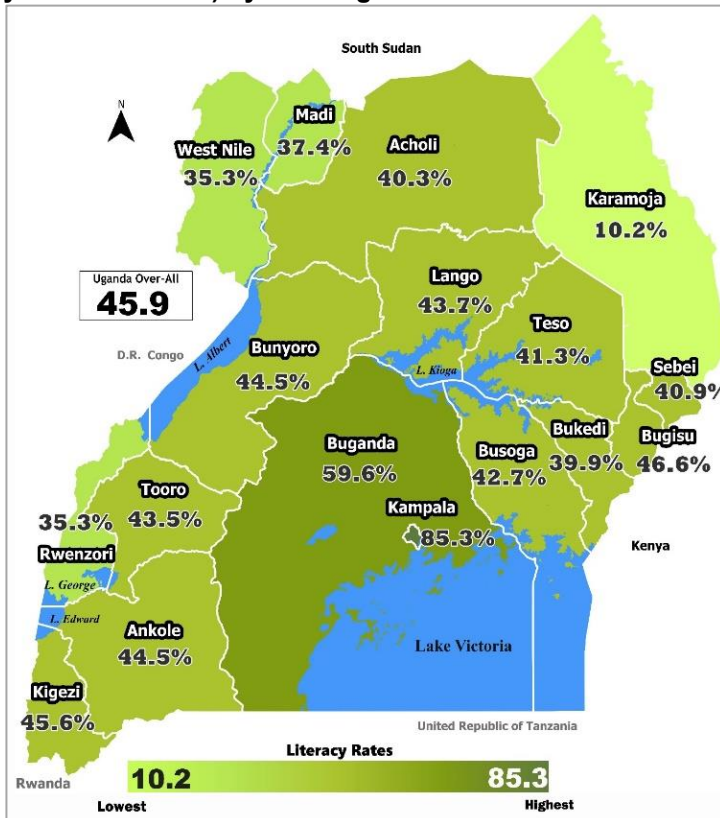

Figure 18.6B: Literacy Rates of the Older Persons (65 years and above) by sub Region

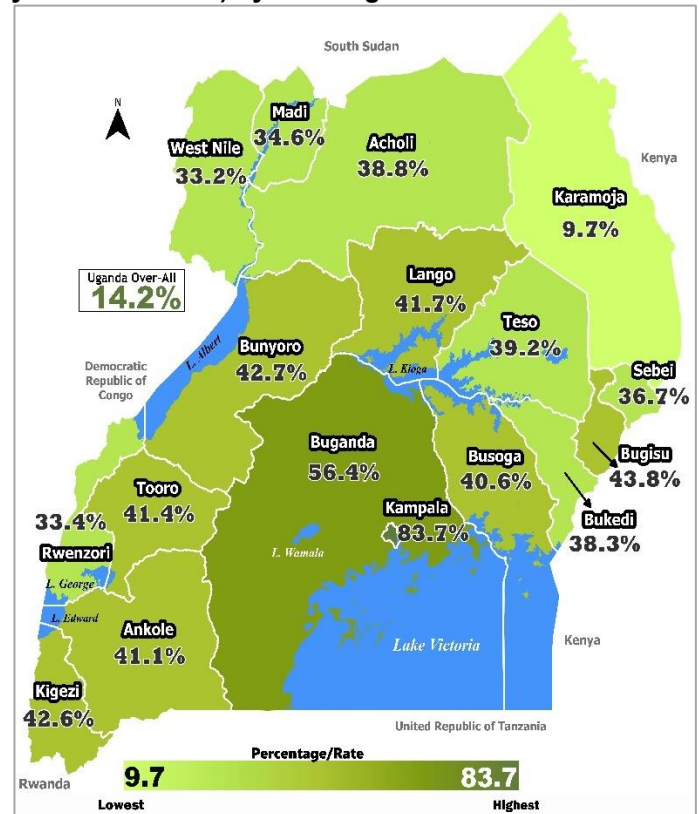

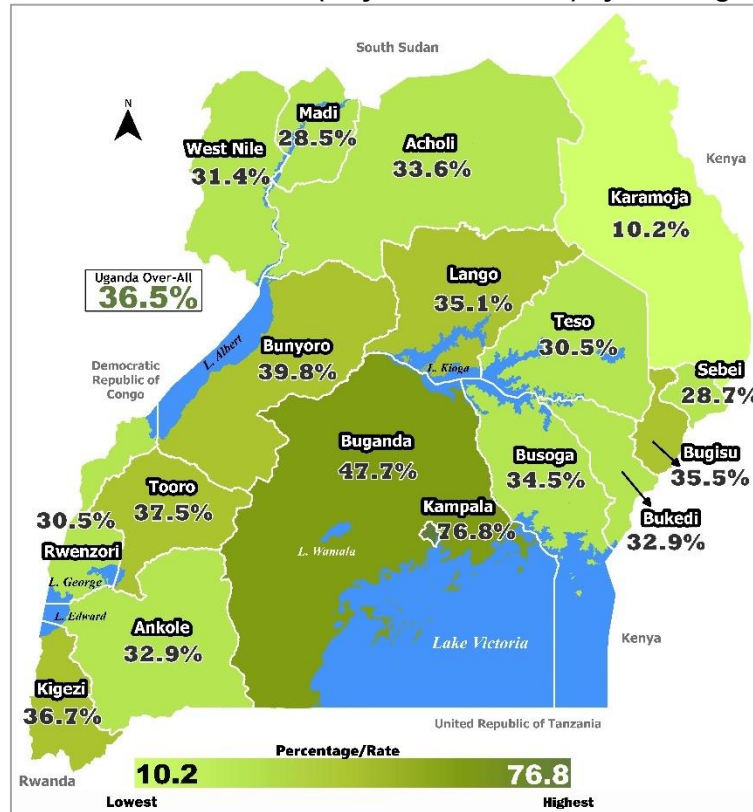

Figure 18. 6C: Literacy Rates of the Older Persons (80 years and above) by sub Region

18.3 Household Characteristics

18.3.1 Households headed by Older Persons

The NPHC 2024 enumerated 10.7 million households. Of these, 1,636,558 were headed by older persons aged 60 and above (Fig 18.7). Among persons aged 80+, there were more (169,752) female household heads than males (145,431). The reverse is true among households headed by older persons aged 60 and above. Table 18.3 provides detailed information on households headed by older persons.

Figure 18. 7: Number of households headed by Older Persons by Sex of household head and Age Group

18.3.2 Average Household Size of Households headed by Older Persons

On average, households headed by older persons aged 60 and above had 5 members (**Figure 18.8**). Households headed by male older persons on average had five members compared to four members in households headed by females. Variations by Sub Regions show that Rwenzori had the highest average household size (5.3 persons). **Table 18.3** provides details on households headed by older persons by age group and selected background characteristics.

Figure 18.8: Average Household Size for households headed by older persons by Sex of household head

18.3.3 Living Arrangements

The household living arrangements of older persons can have important implications for their health, economic status and well-being. While some older persons live alone, others reside with a spouse or a partner, or with their children or grandchildren and other relatives or non-relatives. Understanding patterns and trends in their living arrangements is relevant for the country to achieve the SDGs for Goal 1 on poverty, Goal 3 on health and Goal 5 on gender equality.

Figure 18.9 shows that 13.3 percent of the older persons aged 60 and above were staying in single-person households. Forty eight percent of older persons aged 60 and above were staying in households (48.1%) with five or more household members.

Figure 18.9: Percentage Distribution of Older Persons by Household size for selected Age Group

Key Findings

- **Agricultural households:** Sixty two (62.3%) percent of households were engaged in agriculture.
- **Crop growing:** Six out of every ten (60.7%) agricultural households were engaged in crop growing.
- **Livestock keeping:** Thirty seven (36.7%) percent of agricultural households were engaged in livestock keeping.
- **Purpose for agricultural activity:** Eight in every ten (80.2%) agricultural households practiced agriculture mainly for home consumption.

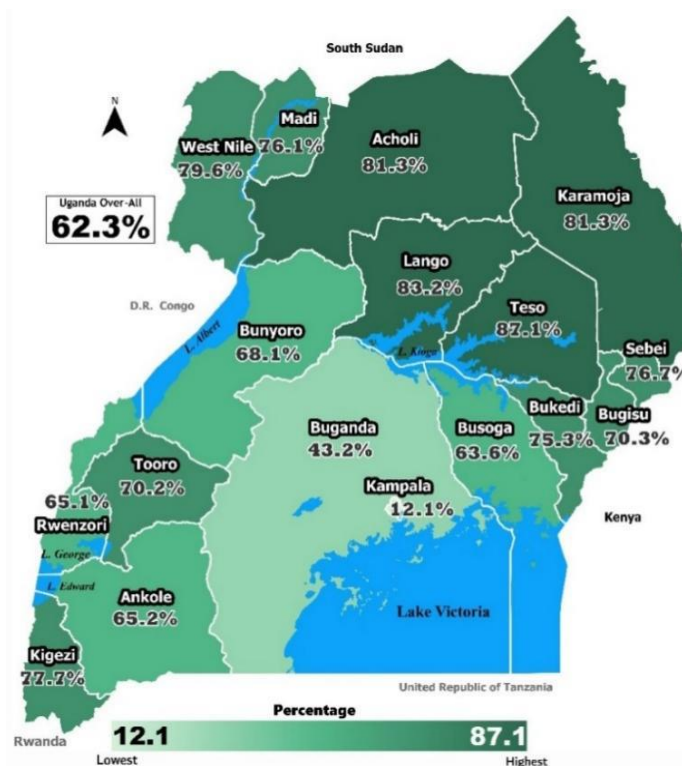

19.1 Households Engaged in Agriculture

An agricultural household refers to any household that had engaged in crop production, livestock keeping, aquaculture production, forestry and woodlots.

Figure 19.1 shows that 62.3 percent of households were engaged in agriculture.

Teso sub-region had the highest percentage of households engaged in agricultural production (87.1%), while Kampala Capital City had the least (12.1%) (Table 19.1)

Figure 19.1 Percentage Distribution of Households engaged in Agriculture by sub Region

19.1.2 Agricultural Activities

Six in ten (60.7%) of households that are in the agricultural sector are engaged in crop production.

Four in every ten (36.7%) of the agricultural households are engaged in livestock keeping.

One in every ten (10.5%) of the agricultural households practiced aquaculture.

Of the agricultural households, only 3.5% were practicing irrigation. (Figure 19.2 and Table 19.1)

Figure 19. 2: Percentage Distribution of Agricultural Households by type of Agricultural Activity

19.2 Crop Growing

Maize was the most commonly grown crop by agricultural households at 49.2 percent, while cow peas and banana beer were the least grown crops at one percent each (Figure 19.3).

Figure 19.3 Percentage distribution of households by Crops grown

The results show the highest proportion of households growing different types of crop (Table 19.5A and B) by sub Region

- i) Lango sub Region had the highest percentage of households growing maize at 73.2 percent .
- ii) Kigezi sub Region had the highest percentage of households growing beans (68.8%), sweet potatoes (55.0%).
- iii) Bugisu sub Region had the highest percentage of households growing banana food - Matooke (52.3%) and Coffee arabica (7%)
- iv) Rwenzori sub Region had the highest percentage of households growing Coffee arabica (8.0%).

19.3 Tree Crop Growing

Tree crop growing refers to the cultivation of tree-based crops. It includes crops like mangoes, avocados, jackfruits and oranges.

Avocado was the most commonly grown tree crop (10.0%), while guava was the least grown (2.3%). (Figure 19.4).

Figure 19.4 Households engaged in Tree Crop Growing (Percentage)

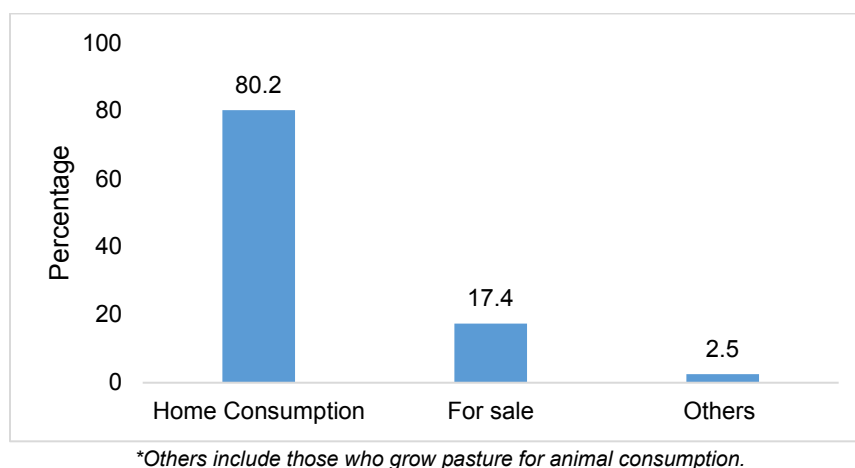

Note: Other tree crops include tangerines, oil palm, cherimoya / sour soup, canarium (empafu), tree tomato, cashew nut, tamarind and pomegranates.

19.4 Main Purpose for Agricultural Activity

Figure 19.5 indicates that 80.2 percent of agricultural households undertook agricultural production mainly for home consumption and 17.4 percent mainly for sale.

Figure 19.5 Agricultural Households by Main Purpose of Agricultural Activity (Percentage)

- i) Kampala Capital City reported the highest percentage (41.1%) of agricultural households undertaking the activity mainly for sale, while Karamoja (7.2%) reported the least.
- ii) Karamoja sub Region highest percentage (90.6%) of agricultural households undertaking the activity mainly for home consumption, while Kampala Capital City (55.7%) reported the least (**Table 19.2**)

19.5 Livestock- Keeping

Overall, 36.7 percent of the households were engaged in livestock keeping. The highest percentage of households kept chicken (78.6%) while the least kept rabbits (4.6%).

Figure 19.6 Agricultural households by type of livestock kept (Percentage)

The Census shows that the highest percentage of households keeping livestock were in Teso sub Region at 66.6 percent and lowest in Kampala Capital City at 6.7 percent. (Table 19.1)

Disaggregation by sub Regions shows that Acholi sub Region had the highest percentage of households keeping chicken at 87.2 percent each, while Kigezi had the lowest with 51.0 percent (Table 19.3)

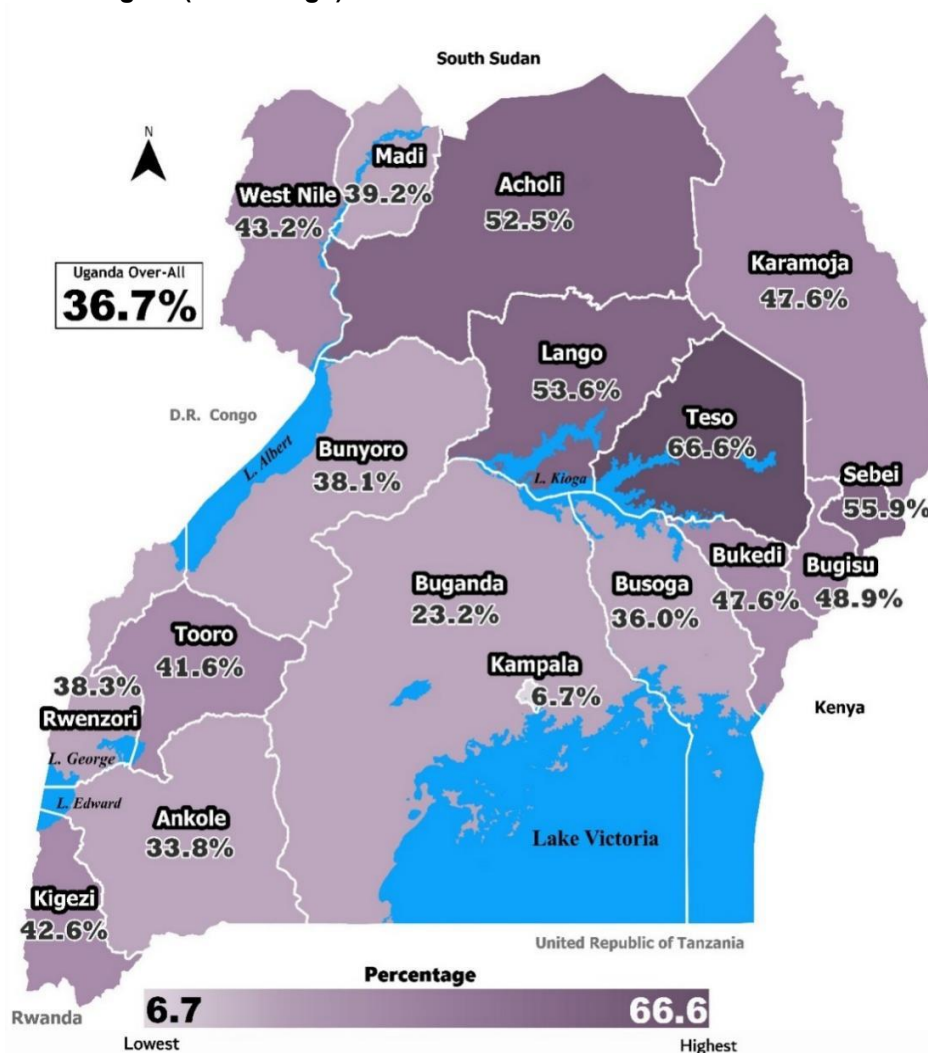

The highest percentage of households keeping goats was found in West Nile at 68.9 percent and lowest in Kampala Capital City at 31.0 percent.

The highest percentage of households keeping cattle was found in Karamoja at 67.8 percent and lowest in Rwenzori at 6.1 percent.

The highest percentage of households keeping sheep was found in Karamoja at 50.9 percent and lowest in Busoga at 3.8 percent.

The highest percentage of households keeping pigs was found in Bunyoro at 46.0 percent and lowest in Sebei at 9.4 percent.

Figure 19.7 Households engaged in Livestock keeping by sub Region (Percentage)

Key Findings

Food Secure Households: Five in every ten (54.0%) households were food secure. Ankole sub Region had the highest proportion (70.4%) of food secure households. Karamoja sub Region had the highest proportion (62.9%) of severely food insecure households.

Sustainable Development Goal 2 aims to end hunger, achieve food security, improve nutrition, and promote sustainable agriculture by 2030. The continental, regional and national development frameworks such as Agenda 2063, EAC Vision, NDP's, and Vision 2040 promote interventions targeted to address food insecurity.

Using the eight Food Insecurity Experience Scale (FIES) questions, the NPHC 2024 evaluated respondents' personal experiences with food insecurity in the household over the 12 months preceding the Census Enumeration Exercise. The respondent answered on behalf of all household members. Overall, 92 percent of the households answered the FIES questions with either yes or no, 6 percent with a "don't know," and two percent chose not to respond. This data was analyzed to construct **SDG indicator 2.1.2**, which evaluates the prevalence of moderate or severe food insecurity in the population, based on the FIES methodology.

20.1 Households' Food Insecurity Experience

The Food Insecurity Experience Scale (FIES) is a globally recognized approach developed by the FAO (Food and Agriculture Organization) to measure food insecurity based on people's direct experiences. It captures a range of experiences related to food access difficulties, from mild to severe insecurity, and reflects the intensity of food insecurity at household levels using the eight FIES questions.

The FIES approach collects data on house's direct experiences with food access problems through questions like whether they worried about food, had to eat less, or went a day without food, allowing for a precise classification of food insecurity level due to lack of enough money and other resources.

Figure 20.1: Percentage Distribution of Households' Food Insecurity Experience

Findings in **Figure 20.1** show that 54 percent of the households were food secure while 46 percent of households were moderately/severely food insecure.

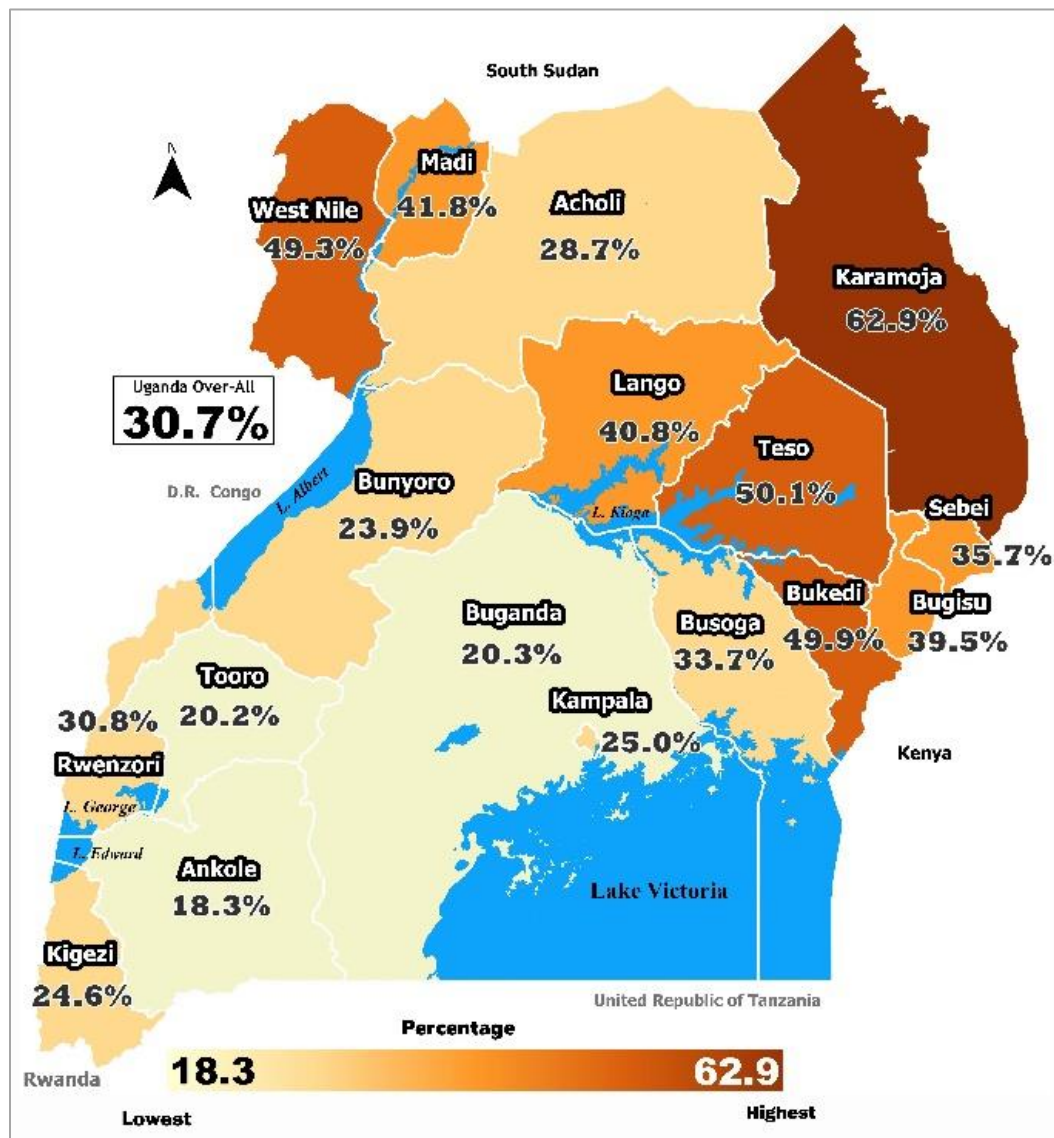

Of the moderate/severe food insecure households, 30.7 percent were severely food insecure.

20.2 Severe Food Insecurity at sub Region Level

Severely food insecure households are those that have experienced the most severe forms of food insecurity, as measured by the FIES. This typically includes households that encountered the most extreme forms of food insecurity as explained in the concepts. Severe food insecurity is defined as "frequent and prolonged periods of insufficient food intake due to a lack of money and other resources." This results into households skipping meals or going the entire day without a meal

Figure 20.2 shows that Karamoja sub Region had the highest (62.9%) likelihood of households facing severe food insecurity while Ankole sub Region had the lowest (18.3%). in (**Table 20.1**).

Figure 20.2: Prevalence of Severe Food Insecurity by sub Region

RECOMMENDATIONS

This chapter highlights operational and policy implications from the key findings of the NPHC 2024. It is important to note that while some implications have been identified, a few will require extensive investigation through further studies/research to make more meaningful conclusions.

21.1 Some issues of Policy

During processing and analysis of the data from NPHC 2024, analysts followed the internationally accepted best practices notably; the United Nations Principles and Recommendations for National Population and Housing Censuses Revision 3, International Labour Organisation and World Health Organization, among others. The main challenge arose where some national policies and practices such as National Employment Policy 2021, National Youth Policy 2021 and Revised National Policy on Persons with Disabilities 2023 are not properly aligned to the international standards and guidelines. For global comparability purposes, the findings in this report have adhered to the internationally recommended practices. However, the report also provides for the national policy frameworks wherever they are in conflict with international principles and guidelines. The implication for this is for users to interpret the two results cautiously. It is recommended that national policies should, as much as possible, be aligned to the international conventions ratified by the country to avoid similar and associated difficulties in future.

21.2 Population Size and Distribution

Uganda's population is still growing at a fast rate of 2.9 percent although it has slightly reduced from 3.0 percent in 2014. Of 45.9 million persons in Uganda as of May 2024, 49.6 percent were children (aged 0-17), 23.5 percent were youth (aged 18-30) while 5 percent were older persons (aged 60 and above). In addition, 99.8 percent of the population stated that they were religious. The population density has increased from 173 persons per square kilometer to 190 persons per square kilometer. This has several implications:

- i) The age distribution of population, with a largely young and youthful population suggests the need for sustained focus on harnessing the demographic dividend. Interventions to increase health, education, skills and employability of the population for increased productivity are very critical. Thus, the design of key Government programmes focusing on education, skilling of children and youth, job creation for the youth and social welfare for older persons should be informed by the population distribution and location for effective targeting and impact. This has profound implications for programmes oriented towards employment creation and full monetization of the economy, among others.
- ii) The sustained increase in population density amidst fixity of land and depletion of biological resources calls for a stronger focus on land use planning and management to promote more desirable social and environmental outcomes, and more efficient use of resources.
- iii) The high variation in the daytime population in Cities compared to night population, especially Kampala Capital City, indicates the importance of the role of planning and social service delivery mechanism in Cities and towns.
- iv) With Uganda's population exhibiting a high level of religiosity with only 0.2 percent stating

that they had no religion, the role of religious institutions in supporting the implementation of public interventions such as mindset change, civic education and community mobilization for successful parish development model, public health, to mention just a few.

21.3 Education

Early childhood education (ECE) and primary education form is an important cornerstone to human capital development. Early Childhood Education is for children aged 3-5, while primary education is for children aged 6-12. Four in ten (41.6%) children aged 3-5 attended Early Childhood Education (ECE) and 75.2 percent of children aged 6-12 attended primary education. Of those aged 13-18, six in every ten (62%) attended secondary education while 17.5 percent of persons aged 19-24 were in post-secondary education during the year of Census. These findings have several implications:

- i) ECE is a crucial stage of development in a child's education cycle as it increases their opportunity to perform better in school and in life. The low access to Early Childhood Education (ECE) calls for increasing public sector investment in ECE to supplement the interventions by private sector players.
- ii) Twenty percent (20.2%) of persons aged 10 and above having no formal education creates a pool of illiterate and unemployable population. This could be bridged by investing in informal and modular skills-based training programs for a productive and skilled population.
- iii) With three in every ten (33.3%) of persons aged 13 to 18 attending secondary education, substantial public expenditure to cater for school infrastructure and fees at this level is necessary. Programmes such as Universal Secondary Education should be strengthened to improve enrolment and completion.

21.4 Health

- i) **Enhancing Routine Childhood Vaccination Programs:** Vaccination coverage of 86.9 percent among children aged 0-2 years implies that immunization programs should be maintained and increased. This requires government to put in place strategies focusing on sustaining public awareness campaigns, particularly in regions with lower coverage, to ensure all children receive vaccinations on schedule.
- ii) **Expanding Health Insurance Coverage:** With only one percent (1.1%) of the population having health insurance, there is a need to develop policies that promote affordable health insurance schemes. Incentives for both private and public health insurance providers could help increase coverage and reduce out-of-pocket expenses for families falling bottom 40 percent. Mindset change campaigns aimed at sensitizing the public to embrace the health insurance schemes are crucial, coupled with leveraging both private and public financing will be critical to increase coverage and uptake.
- iii) **Addressing Mental Health problems:** The census revealed that one in every 10 (12%) of persons aged 10 and above are likely to be experiencing general psychological distress; with 7.8 percent suffering from probable depressive disorder, 4.0 percent probable bipolar effective disorder, 3.8 percent likely experiencing anxiety disorders and one in one hundred (0.9%) with suicidal tendencies. These estimates, in different mental health constructs, signify existence of mental health problem in the country. Policies and interventions for addressing the mental health issues are,

therefore, warranted.

iv) **Detailed investigation into Mental Health issues:** The census questions only identified probable general psychological distress. Proper identification and diagnosis of a psychiatric disorder requires use of factor analysis to come up with a global psychological construct like 'psychological distress'. Thus, a deeper research on this subject using census data as a sampling frame to develop and test the hypotheses on mental health is recommended.

v) **Improving Health Outbreak Response:** One out of every three (slightly over 30 percent) of households have an understanding of early signals of health outbreaks. Given the community's low and varying understanding of health outbreaks, it is essential to implement sensitization programs that clarify what constitutes an outbreak and appropriate response mechanisms to the outbreaks. Strengthening surveillance systems and ensuring rapid response capabilities could help mitigate the impact of future health crises.

21.5 Fertility

i) **Promote Female Education and Empowerment:** Total Fertility Rate (TFR) of 4.5 children per woman, though having declined from 5.2 in 2014, is still high. The census data indicate that fertility levels vary significantly with women's educational background and years of schooling. Policies should focus on improving girls' access to education and promoting gender equality, as higher educational attainment is associated with lower fertility rates. Investment in programmes that keep girls in school and empower them through vocational training can lead to better reproductive choices and health outcomes.

21.6 Mortality

i) **Strengthen Maternal and Child Health Services:** To reduce maternal mortality, which currently stands at a Maternal Mortality Ratio (MMR) of 207 per 100,000 live births, it is crucial to enhance maternal healthcare services. This includes increasing access to skilled birth attendants, ensuring availability of emergency obstetric care, and implementing comprehensive antenatal and postnatal care programs. Targeted interventions should focus on high-risk regions such as Karamoja, where maternal mortality rates are significantly higher.

ii) **Enhance Data Collection and Reporting on Mortality:** Given the issues of under-reporting deaths in census data, it is essential to improve the reliability of mortality statistics through strengthening Vital Registration system and Reporting of vital events at lowest administrative unit. This includes training community health workers to accurately report deaths, implementing community-based surveillance systems, promoting public awareness on the importance of reporting all deaths and investing more in vital statistics.

iii) **Improvement in Life Expectancy:** Life expectancy is an outcome measure of wellbeing. Improvement in life expectancy at birth from 63.7 years in 2014 to 68.2 in 2024 implies significant impact of social services such as health, education and welfare interventions on reducing infant mortality. Going forward, investment in these interventions should be increased and sustained.

21.7 Labour Force

- i) The Government should invest in expanding access to quality skills-based education, Business, Technical and Vocational training programs, borrowing from the Chinese model that emphasizes skills-based education right from Early Childhood Education. This includes developing partnerships with educational institutions and the private sector to create relevant apprenticeship and training programs that align with the needs of the job market.
- ii) Implement policies aimed at promoting gender equality in the workforce, such as targeted employment programs for women, mentorship initiatives, and support for women entrepreneurs. Additionally, ensure that workplaces adopt family-friendly policies that support work-life balance, making it easier for women to enter and remain in the labour force.
- iii) The Government should develop targeted employment programs for youth, including internships, apprenticeships, and entrepreneurship support. Collaborating with private sector stakeholders to create job placement opportunities could help bridge the gap between education and employment for the youth. In addition, mandatory programs similar to national service to change the mindset for the youth towards work should be explored to reduce the high proportion of youth Not in Employment, Education or Training (NEET).

21.8 Housing and Household Characteristics

- i) **Promote Affordable Housing Initiatives:** Given the high percentage of owner-occupied dwelling units (65.8%) and the significant variation in ownership across regions, the government should implement policies that promote affordable housing initiatives. This can include providing subsidies, low-interest loans, or tax incentives to encourage home ownership, especially in regions like Buganda where renting is more prevalent. Collaborating with private developers to construct affordable housing units can also help meet demand.
- ii) **Address Overcrowding in Housing:** The Census 2024 results indicate 46.0 percent of households do experience overcrowding, this should prompt targeted interventions. The government should develop housing policies that encourage the construction of adequate living spaces to reduce overcrowding. This can involve zoning regulations that promote the development of larger homes and multi-unit housing options.
- iii) **Improve Sanitation Facilities and Access to Clean Water:** With 18.9% of households relying on unimproved water sources and 49.7% with un-improved sanitation facilities, policies should focus on improving access to clean drinking water and adequate sanitation. This can be achieved through investments in water infrastructure, such as boreholes and piped water systems, as well as expanding sanitation programs that encourage the construction of safe toilet facilities, especially in regions like Karamoja with high rates of open defecation.
- iv) **Enhance Energy Access and Promote Clean Energy Sources:** The reliance on wood (64.5%) and charcoal (28.2%) for cooking poses health risks and environmental degradation threats. Policies should prioritize expanding access to affordable clean and renewable energy sources, such as solar and biogas. This can include Government incentives for households to switch to cleaner cooking technologies and subsidize the costs of solar home systems. Educational campaigns can also raise awareness about the health benefits of using clean energy.

v) **Strengthen Waste Management and Environmental Health Policies:** With 91.6% of households using improper waste disposal methods, it is crucial to implement policies that enhance solid waste management. This can include establishing waste collection systems, promoting community-based waste management initiatives, and educating the public about proper disposal practices. Furthermore, the government should integrate waste management into urban planning to mitigate environmental hazards and improve public health.

vi) With only about half of the population (58.0 percent) owning land with documents of ownership, there is need for a specific intervention to increase land registration and documentation. This is critical since land serves as a critical factor of production and its registration enables easy transfer of ownership which in turn eases access to other factors of production like capital.

21.9 Subsistence Economy and Household Welfare

i) The significantly higher proportion of households (33.1%) still in the subsistence economy suggests that the country should continue to prioritize interventions for commercialization of agriculture and full monetization of the economy. Affirmative action may be required for Karamoja that accounted for the highest proportion (70.9%) of households in the subsistence economy.

ii) **Strengthen Support for Agricultural Productivity:** Agricultural extension services that provide subsistence farmers with access to improved farming techniques, quality seeds, and tools should be developed. This includes investing in irrigation and infrastructure to enhance productivity, ensuring food security and increasing market access for surplus produce. Food silos across all sub-Regions could go a long way in stemming high levels of food insecurity in the country

iii) **Implement Social Protection Programs:** There is need to design and implement comprehensive social safety nets and cash transfer programs aimed at households living below the poverty line. These programs should specifically target the most vulnerable groups, providing them with immediate relief and supporting long-term economic resilience.

iv) **Promote Gender Equality in Asset Ownership:** Policies that promote equal access to land and property rights for women and marginalized groups should be developed. This may entail legal reforms to strengthen land tenure security and awareness campaigns to educate communities about the importance of equitable asset ownership for improving household welfare.

21.10 Children

i) **Strengthen Birth Registration Processes:** Enhance the implementation of the Registration of Persons Act, 2015, by increasing awareness campaigns in rural and underserved communities about the importance of birth registration within the stipulated 90 days. Ensure that resources and personnel are adequately available to facilitate timely registration.

ii) **Expand Access to Quality Education:** Implement targeted programs aimed at reducing the number of out-of-school children, particularly in sub Regions with the highest rates, such as Karamoja and West-Nile. This can be achieved by providing incentives for school attendance, increasing the number of schools, and improving school infrastructure, particularly in rural areas.

iii) **Implement Comprehensive Support Systems for Orphans and Vulnerable Children:** Develop and expand social protection programs specifically targeting orphaned children and

those at risk. This should include access to educational scholarships, healthcare, and psychosocial support services tailored to their unique needs.

- iv) **Promote Awareness and Prevention of Early Childbearing and Marriage:** Launch community-based awareness programs addressing the risks of early childbearing and marriage, emphasizing the importance of education and reproductive health. Partner with local organizations to engage communities in discussions about gender equality and children's rights.
- v) **Improve Living Conditions for Children:** Develop and fund initiatives aimed at improving the living conditions of children, particularly in underprivileged sub Regions. This could include investing in infrastructure for clean energy, improved water sources, and sanitation facilities. Policies should prioritize vulnerable populations and target areas with high rates of open defecation and inadequate housing conditions.

21.11 Older Persons

- i) **Enhance Data Collection and Research on Older Persons:** Establish a comprehensive and continuous data collection system focused on older persons to inform evidence-based policy development and planning. This system should include demographic characteristics, health status, education levels, and living conditions to ensure that policies address the specific needs of this population.
- ii) **Increase Access to Adult Education and Literacy Programs:** Develop targeted educational and literacy programs for older persons, particularly for those with low levels of formal education. These programs should focus on basic literacy and life skills, enhancing their ability to engage in economic, social, and cultural activities. Partnerships with local organizations and community centers can facilitate the implementation of these programs.
- iii) **Strengthening Social Support Systems and Livelihood Opportunities:** Create initiatives to provide financial and social support to older persons, including expanding access to government programs such as the Social Assistance Grant for the Elderly (SAGE). Additionally, promote alternative livelihood programs that reduce dependency on subsistence agriculture, enabling older persons to contribute economically through age-appropriate work opportunities.
- iv) **Promote Older Persons' Involvement in Community Affairs:** Implement community awareness campaigns to recognize and celebrate the contributions of older persons in society. Encourage their active participation in local governance, community decision-making processes, and leadership roles, ensuring their voices are heard and respected. This involvement can enhance their social integration and reduce feelings of isolation and marginalization.

21.12 Refugee Characteristics

- i) **Enhance Registration and Data Collection:** Strengthen the registration process for refugees to ensure accurate administrative data compilation on demographics, living conditions, and access to services.
- ii) **Improve Access to Education and Literacy Programs:** Develop and expand education and literacy programs tailored for refugees, focusing on children and older persons with limited formal education.

iii) **Facilitate Economic Inclusion and Employment Opportunities:** Implement policies that promote economic inclusion for refugees, including access to work permits and training programs that enhance skills and employability.

iv) **Promote Digital Inclusion and ICT Access:** Enhance access to information and communication technology (ICT) for refugees, focusing on mobile phone and internet accessibility.

v) **Develop Inclusive Health and Support Services:** Establish comprehensive health and support services that address the specific needs of refugees, including those with disabilities, mental health support, and maternal care.

APPENDIX

ANNEX 1: TECHNICAL NOTE ON DEATHS REPORTING IN NATIONAL POPULATION AND HOUSING CENSUS (NPHC) 2024.

1 Background

The NPHC 2024 generated data on mortality in the country. These ranged from infant, under-five, maternal mortality and overall mortality. The infant mortality rate was reported as 34 deaths per 1,000 live births; the under-five mortality rate as 46 deaths per live 1,000 deaths; maternal mortality ratio was reported as 207 maternal deaths per 100,000 live births, while overall mortality was estimated at a life expectancy at birth of 68.2 years. This composed of a life expectancy of 66.9 years for males and 70.1 years for females.

The indices on infant mortality, under-five mortality, maternal mortality and life expectancy represented a decline in mortality in the country over the 10 year period since the 2014 census. The infant mortality rate declined from 50; the under-five mortality rate from 74; the maternal mortality ratio from 380, while the life expectancy at birth increased from 63.7 years to 68.2 years. Mortality decline, especially in the segments of infant mortality and an increase of overall life expectancy at birth is associated with general improvement in the population's standard of living. The downward trend is seen in the country's census and intercensal performance on a number of social and economic indicators as presented in Table A.1.

Table A. 1. National Trends in Key Development Indicators between 2014 and 2024

Indicator	2014	2016	2020	2022	2024
% in subsistence economy	69%				33.1%
Poverty level***		21.4%	20.3%		16.9%
Literacy level for female aged 10 and above	44.1%				71.6%
% food insecure					46%
% children sleeping under mosquito net previous night**		63.2%		76.3%	
% pregnant women sleeping under net**		65.9%		80.3%	
% with no toilet	8.3%				6.7%
% Under five children with fever**		33.3%		23.4%	
Immunization(13-23 months)**		55.2%		62.5%	
Stunting(0-59moths) **		28.9%		24.4%	
Wasting(0-59moths) **		3.5%		3.2%	
Underweight(0-59moths) **		10.5%		9.7%	
Infant Mortality Rate per 1000 live births	50				34
Under 5 Mortality Rate per 1000 live births	74				46
Maternal Mortality Ratio per 100,000 live births	380				207

2014 and 2024 are Census results for respective years

** Uganda Demographic and Health Surveys

*** Uganda National Household Surveys

2 The Problem

While there is a clear downward mortality trend between the two censuses, with all the supporting correlates pointing in the right direction, there are logical inconsistencies in the 2024 census results for Bukedi, Karamoja and Madi sub Regions. These sub Regions have reported some of the lowest infant mortality rates in the country. Karamoja, particularly had by far the lowest infant mortality rate of 14 per 1,000 live births, Madi with 19 deaths per 1,000 live births and Bukedi with 27 deaths per 1000 live births. The infant mortality rates for Karamoja, Madi and Bukedi are noticeably lower than the national average of 34 deaths per live 1,000 live births. These outliers suggests possible under reporting of deaths in infants in the three sub Regions.

Further examining other socioeconomic development correlates in the Karamoja and Bukedi sub Regions when compared with the national trend helps to check the consistency of the deaths data. The results of the comparison are presented in Table A.2.

Table A.2. Comparative Development Indicators across the National and Target Regions

Indicator	Karamoja	Bukedi	National
Structural indicators			
%age of households in subsistence economy	70.9	49.9	33.1
%age of persons below absolute Poverty line (One US dollar a day)	72.0	29.3	16.9
Outcome indicators			
Literacy level (female %)	21.5	66.7	71.6
% food insecure	81.4	50.1	46
% children sleeping under mosquito net previous night**	69.7	65.4	76.3
% pregnant women sleeping under net**	72.6	72.4	80.3
% with no toilet	60.2	11.3	6.7
% fully immunized**	33.4	55.8	62.5
Impact indicators			
% Stunted**	41.1	27.2	24.4
% Wasted**	11.9	1.5	3.2
% Underweight**	30.4	10.5	9.7

** 2022 Uganda Demographic and Health surveys

Indicators not in asterisks are from NPHC 2024

Table A.2 shows that on all the intercensal development indicators, Karamoja and Bukedi sub Regions performed below the national average. The structural indicators measure the setting in which the reference population lives. The structural indicators, being subsistence economy and living in poverty, tend to give the basis which would likely determine the direction that the more dynamic progress indicators could take. In particular, Table A.2 shows that a third of the national population is in the subsistence economy and a fifth of the population lives below the absolute poverty line.

Table A.2 further shows that 71 percent of the population of Karamoja are in a subsistence economy, as does half the population of Bukedi. In terms of the absolute poverty level, 72.0 percent of the

population of Karamoja and 29.3 percent of the population of Bukedi live below the absolute poverty line, which is above the national average of 16.9 percent.

Theoretically, and building from the structural indicators, the outcome indicators are enablers for the population to realize the expected impact of the development interventions. One of these is the literacy level among the female population aged 10 and above. The national female literacy rate is 71.6 percent while 21.5 percent of female in Karamoja is literate. Two thirds of the women of Bukedi region were literate.

Food security is also considered a critical pathway to achievement of development impact. Table A.2 shows that at the national level, only 46 percent of the households were food insecure. Comparatively, over 80 percent of households in Karamoja and over a half of the households in Bukedi were food insecure.

One of the leading cause of infant and child mortality and morbidity in Uganda is malaria. It is, therefore, important to track the indicator of children sleeping under mosquito nets at night. It can be seen in Table A.2 that nationally, 76.3 percent of the children below five years slept under mosquito nets during the night preceding the Uganda Demographic and Health Survey 2022. In the case of Karamoja, the proportion was only about 70 percent, while in Bukedi it was 65.4 percent. The danger posed by malaria to children is also echoed among pregnant women. A similar indicator is also tracked as part of streamlining the development pathway. It is observable from the table that over 80.3 percent of the pregnant women at the national level slept under a mosquito net the night before the Uganda Demographic and Health Survey 2022. The corresponding proportions for Karamoja and Bukedi are 72.6 percent and 72.4 percent.

Toilet hygiene is another household factor that is important in the children's development context. The table shows that at the national level, only about 7 percent of households reported having no toilet facilities. The proportion of households reporting no toilet facilities in Bukedi is more than 11 percent, while as many as 60 percent of households in Karamoja reported having no toilet facilities.

An important outcome indicator child survival is the level of full immunization among under 5 children. Table A.2 shows that the national full immunization level stands at 62.5 percent. On the other hand, 55.8 percent of the children 13-23 months were fully immunized in Bukedi region, while in Karamoja region, 33.4 percent of them are fully immunized.

The above outcome indicators are expected to have combined in the lives of the different segments of the population to produce the expected development impact. In the present case, the development impact is infant survival, the antithesis of infant mortality. Two critical nutrition pathways to this result have been established to be through the levels of child stunting and underweight in the population. At the national level, child stunting is reported as 24.4 percent. On the other hand, 27.2 percent of the under 5 children in Bukedi are stunted. Stunting is a much bigger problem in Karamoja where 41.1 percent of the under 5 children are stunted. Similarly, while 9.7 percent of the under 5 children are under-weight national level and 10.5 percent in Bukedi, the proportion in Karamoja is much higher at 30.4 percent.

3 Discussion

The above problem analysis points to an incongruence in development indicators that should theoretically have produced the development impact of infant mortality reduction. While the fact of a marked reduction in infant mortality is undeniable in all the regions in the country, the steepness of the slope in these two regions becomes highly suspect when nearly on all the corresponding development indicators, the two sub Regions in question performed more poorly than the national average. The

same situation is suspected to be happening in Madi sub Region. It is important to note that Madi sub Region was not treated as a separate from West Nile region in previous studies.

It is probable, therefore, that there was underreporting of deaths, particularly of infants in Karamoja, Madi and Bukedi. With the births and deaths registration system not fully developed yet, it is difficult to conduct an inter-system assessment on the differential death reporting.

The effect of infant death underreporting is amplified due to the mortality estimation method being used. It is essentially based on the ratio of the survival probability from birth to age one (${}_1q_0$) to the survival probability from age one to age 5 (${}_4q_1$). In other words, the ratio $({}_1q_0) : ({}_4q_1)$ will be underestimated if there is an overreporting of survival from birth to age one. In case of better estimation methods in future, this may give an erroneous impression of a substantial increase in mortality in Karamoja, Madi and Bukedi or any other sub Region that might have under reported deaths in infants and children.

More importantly, some key informant discussions have also pointed to cultural tendencies against discussion of dead people, especially among children. Although these are still at anecdotal level, they should be investigated in order to develop a response strategy to counteract this cultural bias.

4 Recommendations

The above analysis has demonstrated that there is most likely an underreporting of deaths, especially at infant level in Karamoja, Madi and Bukedi, might have distorted mortality estimation process for the three sub Regions.

Two recommendations have emerged from the above analysis namely:

- i) To get to the bottom of the problem, a dedicated mortality survey with a qualitative component to unpack the confounding cultural component is to be undertaken by the Uganda Bureau of Statistics.
- ii) The mortality study should be accompanied with a mini births and deaths registration (BDR) exercise as a further evaluation tool for births and deaths reporting. This BDR should be implemented by National Identification and Registration Authority (NIRA) in collaboration with Uganda Bureau of Statistics

5 Conclusion

The infant mortality rate, under 5 Mortality and life expectantancy in the three sub Regions is excluded the report.

ANNEX 2: SELECTED INDICATORS BY DISTRICT AND SUB REGION

Table A1A: Population Distribution by Regions, Districts and Sex

District/City	Male	Female	Total
